# **Document Change Record**

| Section        | Reason For Change   |  |  |
|----------------|---|--|--|
| 5.2.1          | (in version 1.2b) Current velocity and current speed TM parameters listed as having signed 32-bit |  |  |
|                | values (they can take on positive or negative values)   |  |  |
| 5.2.1, 4.1.3.2 | (in version 1.2b) Added additional direction field: NO_DIRECTION (equal to 2). This value         |  |  |
|                | appears in housekeeping packet's direction field when stage is not moving.                        |  |  |
|                | Changes section removed – Document Change Record (this section) marks changes between             |  |  |
|                | versions.   |  |  |
| 1              | Introduction: Test FTS used to test SPIRE FTS and photometer.                                     |  |  |
| 3, 4           | Sections titled TBD or not used/applicable have been removed.                                     |  |  |
| 2.1.2, 2.1.3,  | All references to checksum changed to CRC   |  |  |
| 4.1.1.2.1      |   |  |  |
| 2.1.2          | Comprehensive description of the ACK bits in the telecommand header.                              |  |  |
| 2.1.4          | Table 1 – names of TM acknowledgement /execution services corrected, HK packet labelled as        |  |  |
|                | running continuously.   |  |  |
|                | Removed mention of TFTS Status Report and TFTS Time Report (both of which have been removed       |  |  |
|                | due to being redundant with Housekeeping Report)  |  |  |
| 2.1.6.1        | State diagrams of TC acknowledgements: changed to reflect correct acknowledgement behaviour.      |  |  |
| 2.1.6.2        |   |  |  |
| 2.1.6          | In Long Duration Function Execution Stages, Table 3: perform_scan telecommand has 1 stage         |  |  |
|                | (formerly 3). This is due to repeating nature of program steps generated by this function, which  |  |  |
|                | SCOS cannot handle.   |  |  |
|                | reset_IFIS and reset_limit telecommands are now considered a long-duration function (with no data |  |  |
|                | returned).  |  |  |
| 3.2.1.1        | Telecommand Packet Definition describes which telecommands can run concurrently with other        |  |  |
|                | select telecommands.  |  |  |
| 3.2.1.1.9      | Perform Scan: changed size of comment field from 320 bytes to 80 bytes.                           |  |  |
|                | Name of scan changed from single sided scan to simply "perform scan"                              |  |  |
| 3.2.1.1.11     | Abort sets Housekeeping Report TM(3,25) TASK_STATUS to state=ABORT                                |  |  |
| 4.1.1.6        | Telecommand Execution Report – Failed (1,8): added FAILURE_CODE field.                            |  |  |
| 4.1.3.1        | In housekeeping packet description:   |  |  |
| 4.1.3.2        | Housekeeping TM packets now sent continuously for duration of TFTS server run time.               |  |  |
|                | DPU_COUNTER_TIME field in Housekeeping Report TM(3,25) replaced with                              |  |  |
|                | DPU_CNTR_RESET_TIME.  |  |  |
|                | New state for Housekeeping TASK_STATUS field added "ERROR"  |  |  |
|                | 1 U500 SW STATUS field added to Housekeeping Report TM(3.25)                                      |  |  |

# SPIRE Test Facility FTS Data ICD

|           | Tables 8 and 9, which describe contents of U500_HW_STATUS and U500_SW_STATUS (status              |  |  |  |
|-----------|---|--|--|--|
|           | fields for U500) have been moved to Housekeeping Report section.                                  |  |  |  |
| 4.1.3.3.1 | DPU Counter Error Exception Report error codes (DPU COUNTER ERR) have been changed.               |  |  |  |
| 4.1.3.3.2 | U500 Exception Report now has 3 varieties: Other Error, Feedback Error, and Limit Error.          |  |  |  |
| 4.1.5.1   | Nominal Science Reports TM(21,1) now contain variable length data fields, instead of fixed length |  |  |  |
|           | fields (which could be padded with zeros if not completely filled). SID defined as 0x2A.          |  |  |  |
| 5.2.1     | DPU_CNTR_RESET_TIME added to TM Parameters: Parameter Definitions                                 |  |  |  |
|           | TIME_SINCE_DPU_COUNTER_RESET removed (redundant data field)                                       |  |  |  |
|           | DPU_CNTR_RESET_TIME field length changed from "4" to "32" (it is 32 bits wide)                    |  |  |  |
|           | PC_SYSTEM_TIME removed due to redundancy.   |  |  |  |
| 4.1.5.2   | Removed TFTS Time Report – no longer needed. Taken over by Housekeeping Report.                   |  |  |  |
| 4.1.5.2   | Removed TFTS Status Report - no longer needed. Taken over by Housekeeping Report                  |  |  |  |
|           |   |  |  |  |

# **1** INTRODUCTION

The Test Facility FTS (TFTS) is a Fourier Transform Spectrometer, which will be used for instrument-level testing of the SPIRE FTS and photometer. The Unidex 500 (U500), a motion controller card that plugs into the TFTS PC's PCI bus, controls the Aerotech linear translation stage on which the spectrometer's scanning mirror is attached. The TFTS PC, running under Windows 2000, hosts the TFTS control software. The control software listens for instructions from the SPIRE EGSE to initialize the TFTS and take interferogram scans. The resulting data sets are packetized and sent back to the SPIRE EGSE. Commands are formatted and sent as telecommand (TC) packets, while data is returned to the EGSE as telemetry packets (TM). Both TM and TC packets are carried over an Ethernet-based local area network.

All telemetry data produced by the SPIRE EGSE systems will follow the same standards used in the Herschel Spacecraft and Ground Segment systems. This will ease transition from testing to the operational environments. TM and TC packets conform to the ESA Packet Utilisation Standards (RD01, RD02, and RD03), and the Herschel Packet Structure ICD (AD01) subset. The TFTS reduced set of telemetry packet types are detailed herein.

# 1.1 Scope

This document defines the packet types and contents that will be accepted and generated by the Test Facility FTS (TFTS). These packets conform to the formats given in the <u>Herschel/Planck Packet Structure Interface Control</u> <u>Document</u> (AD01) and the <u>Herschel Science Ground Segment to Instruments Interface Control Document</u> (AD03).

# **1.2** Structure of the Document

Section 2 describes the packet interface used between the SPIRE instrument and the SPIRE EGSE, including the Test Facility Control System and test equipment. This includes the general format of the packets used by the SPIRE instrument for telecommands and telemetry (from AD01), the allocation of Application IDs used by the instrument, and the functionality of the packet transfer protocol of the instrument/spacecraft interface (from AD01, appendix 9) that is used by the instrument.

Section 3 defines the format and content of each of the telecommand packets accepted by the TFTS. Section 4 defines the corresponding information for the telemetry packets generated by the TFTS. A description of how these packets are handled by the TFTS is given in RD04. Section 5 defines in detail the parameters used within the telecommand and telemetry packets.

# **2** The Packet Interface

# 2.1 Packet Structures

The following packet structures are shown as a set of 16 bit words, contained in two consecutive bytes in the packet structure (all packets are composed of an even number of bytes). The most significant byte of each word comes before the least significant in the packet. The least significant bit of each word is on right of each field:

MS Byte LS Byte Most Significant Bit 000000000000000 Least Significant Bit

## 2.1.1 Fields

Within a field (of any length) the most significant bit is designated bit (0); the least significant bit is bit (length-1).

### 2.1.2 Telecommand Packets

The following figure gives the general structure of a TC Packet (after AD01)

| Packet | Packet ID        | 0 0 0 1 1 APID    |
|--------|------------------|-------------------|
| Header | Sequence Control | 1 1 Src Count     |
|        | Length           | Length            |
|        | Data Field       | 0000001 Type      |
|        | Header           | Sub-Type 00000000 |
|        |                  |                   |
| Data   |                  |                   |
| Field  | Source Data      |                   |
|        |                  |                   |
|        |                  |                   |
|        | Error Control    | CRC               |

- Src, Count, Length, and CRC are defined in AD01.
- Ack (in the first byte of the Data Field Header in white letters) is defined in AD01, page 16. A series of 4 bits, when set in the incoming telecommand, determine the method of acknowledgement the TFTS must make.
  - $\circ$  0 0 0 1 (bit 4): Acknowledge the received telecommand with a Telecommand Acceptance Report Success TM(1,1). This bit is set in all incoming telecommands.
  - $\circ$  0 0 1 0 (bit 3): Acknowledge the start of the function's execution with a Telecommand Execution Report Started TM(1,3).
  - 0 1 0 0 (bit 2): Acknowledge the requested function's execution stages with a Telecommand Execution Report Progress TM(1,5).
  - $\circ$  1 0 0 0 (bit 1): Acknowledge the requested function's completion with a Telecommand Execution Report Completed TM(1,7).

Multiple bits can be logically ORred together, thus requiring the TFTS reply with any of the requested acknowledgements. The TFTS must acknowledge all failures; TM(1,2) if the incoming TC was not properly formed, and TM(1,8) if the function fails during execution.

- Short duration functions will have ACK bits set to 0 0 0 1
- Long duration functions will have ACK bits set to 1 1 1 1
- Type and Sub-Type define the packet type and are also defined in AD01

# 2.1.3 Telemetry Packets

The following figure gives the general structure of a TM Packet (after AD01)

| Packet | Packet ID        | 0 0 0 0 1 APID       |  |  |  |  |
|--------|------------------|----------------------|--|--|--|--|
| Header | Sequence Control | 1 1 Count            |  |  |  |  |
|        | Length           | Length               |  |  |  |  |
|        |                  | 0 0 0 0 0 0 0 0 Type |  |  |  |  |
|        |                  | Sub-Type 00000000    |  |  |  |  |
|        | Data Field       |                      |  |  |  |  |
|        | Header           | TIME                 |  |  |  |  |
| Data   |                  |                      |  |  |  |  |
| Field  |                  |                      |  |  |  |  |
|        |                  |                      |  |  |  |  |
|        | Source Data      | DATA                 |  |  |  |  |
|        |                  |                      |  |  |  |  |
|        |                  |                      |  |  |  |  |
|        | Error Control    | CRC                  |  |  |  |  |

- Count, Length, TIME and CRC are defined in AD01. TIME refers to the time the TM packet was created and is obtained from the PC's clock. In the <u>Nominal Science Report</u>, each data sample is associated with its own timestamp, obtained from the DPU counter.
- Type and Sub-Type define the packet type and are also defined in AD01

### 2.1.4 Telecommands and Telemetry Responses

Below is the mapping between telecommands and telemetry packets. FID=FUNCTIONID, AID=ACTIONID.

| Telecommand          | Service | FID  | AID  | Telemetry  | Service | FID   | AID   |
|----------------------|---------|------|------|--|---------|---|---|
| Set OBSID            | (8, 4)  | 0xC1 | 0x01 |  |         |   |   |
| Set BBID             | (8, 4)  | 0xC1 | 0x02 |  |         |   |   |
| Reset TFTS           | (8, 4)  | 0xF1 | 0x01 |  |         |   |   |
| Home TFTS            | (8, 4)  | 0xF1 | 0x02 |  |         |   |   |
| Reset Limit          | (8, 4)  | 0xF1 | 0x04 |  |         |   |   |
| Move Table           | (8, 4)  | 0xF2 | 0x01 |  |         |   |   |
| Read U500 Parameter  | (8, 4)  | 0xF4 | 0x01 | Diagnostic Science Report                        | (21, 3) | N/A   | N/A   |
| Write U500 Parameter | (8, 4)  | 0xF4 | 0x02 |  |         |   |   |
| Perform Scan         | (8, 4)  | 0xF8 | 0x01 | Nominal Science Report                           | (21, 1) | N/A   | N/A   |
| Run U500 Program     | (8,4)   | 0xF8 | 0x02 |  |         |   |   |
| Abort Scan           | (8, 4)  | 0xF8 | 0x04 |  |         |   |   |
| Truncate Scan        | (8, 4)  | 0xF8 | 0x08 |  |         |   |   |
| Perform Connect Test | (17, 1) | N/A  | N/A  | Link Connection Report                           | (17, 2) | N/A   | N/A   |
|                      |         |      |      | Telecommand<br>Acceptance / Execution<br>Reports | (1, X)* | Sent after<br>telecom<br>depending<br>bits in inc<br>* x = 1, 2,<br>See Telec<br>Behav<br>Descr | received<br>mands,<br>g on ACK<br>oming TC<br>, 3, 5, 7, 8.<br>command<br>rioural<br>iption |
|                      |         |      |      | Housekeeping Report                              | (3, 25) | Sent con  | tinuously   |
|                      |         |      |      | Exception Report                                 | (5, 2)  | Sent c<br>function  | luring<br>failures  |

#### Table 1: Telecommands and their Responses

### 2.1.5 DPU Counter Reset Command

The TFTS DPU counter electronics allows the TFTS instrument to be synchronized with the SPIRE DPU. This is accomplished by driving the TFTS DPU counter with the DPU 312.5 kHz clock line. The TFTS DPU counter is reset upon receipt of a 32-bit counter-reset command on the DPU low speed bi-directional serial bus.

## 2.1.6 Telecommand Behavioural Description

Telecommands used to control the TFTS can be categorized into four distinct behavioural groups. Short duration telecommands take less than one quarter second to execute. Long duration telecommands, on the other hand, take one quarter second or more to execute.

| Function Type                              | Applicable Function     |
|--|-------------------------|
| Short Duration Function - No Data Returned | Set_OBSID               |
|  | Set_BBID                |
|  | Write_U500_Parameter    |
|  | Abort_Scan              |
|  | Truncate_Scan           |
| Short Duration Function – Data Returned    | Read_U500_Parameter     |
|  | Perform_Connection_Test |
| Long Duration Function – No Data Returned  | Home_TFTS               |
|  | Move_Table              |
|  | Run_U500_Program        |
|  | Reset_TFTS              |
|  | Reset_Limit             |
| Long Duration Function – Data Returned     | Perform_Scan            |

#### **Table 2: Telecommand Behavioural Description**

The execution of long duration functions can be broken up into multiple stages. Transitions from stage to stage, which marks the progress of the function, is reported by the TFTS by sending <u>Telecommand Execution Report -</u> <u>Progress</u> packets (service 1,5). The following table shows the stages for each long duration function. Short duration functions are not listed because they do not transmit progress reports.

| Function         | Stage Number | Stage Description                                       |
|------------------|--------------|---|
| Home_TFTS        | 1            | Homing stage  |
| Move_Table       | 1            | Moving Aerotech stage                                   |
| Run_U500_Program | TBD          | TBD   |
|                  |              | Note: this function used for debugging, configuring and |
|                  |              | troubleshooting the TFTS, and won't be used during      |
|                  |              | normal usage of the TFTS.                               |
| Perform_Scan     | 1            | Scanning  |

 Table 3: Long Duration Function Execution Stages

### 2.1.6.4 Long Duration Function – Data Returned

Figure 4: Execution of Long Duration Function (data TM packets returned)

# 2.2 APIDs

The Application ID is used to identify the source or destination of a telemetry packet. SPIRE has been allocated APIDs for different types of packets (see AD01) as well as for EGSE equipment. The APID to be used by the TFTS is given in the following table:

| ID   | Telemetry types   | APID (hex) |
|------|---|------------|
| APID | Telecommands, Telecommand Verification, Events, housekeeping, | 7F5        |
|      | and science data.   |            |

Table 4: Table of APIDs

# 2.3 Packet Transfer Protocol

The packets are transferred between the TFTS and the EGSE following the Packet Router ICD (AD04).

# **3 TELECOMMAND PACKETS**

This section defines all the telecommand packets accepted by the TFTS Simulator.

# 3.1 Telecommand Packet Types

The Packet Structure ICD (AD01) defines many types of service that can be provided by an application. The following table shows the telecommand packet types that will be accepted by the TFTS.

| Description                                | Service | Service Sub- | Comments |
|--|---------|--------------|----------|
|  | Туре    | Туре         |          |
| Telecommand Verification Service           | 1       |              | N/A      |
| Device Command Distribution                | 2       |              | Not Used |
| Housekeeping and Diagnostic Data Reporting | 3       |              | Not Used |
| Event Reporting                            | 5       |              | N/A      |
| Memory Management                          | 6       |              | Not Used |
| Function Management                        |         |              |          |
| Start Function                             | 8       | 1            | Not Used |
| Stop Function                              | 8       | 2            | Not Used |
| Perform Activity of Function               | 8       | 4            |          |
| Report Function Status                     | 8       | 5            | Not Used |
| Time Management                            | 9       |              | Not Used |
| On-Board Scheduling                        | 11      |              | Not Used |
| On-Board Monitoring                        | 12      |              | Not Used |
| Packet Transmission Control                | 14      |              | Not Used |
| On-Board Storage and Retrieval             | 15      |              | Not Used |
| On-Board Traffic Management                | 16      |              | Not Used |
| Test Service                               |         |              |          |
| Perform Connection Test                    | 17      | 1            |          |
| On-Board Control procedures                | 18      |              | Not Used |
| Action/Event Service                       | 19      |              | Not Used |
| Information Distribution Service           | 20      |              | Not Used |
| Science Data                               | 21      |              | N/A      |
| Context Saving Service                     | 22      |              | Not Used |

**Table 5: Telecommand Packet Definitions** 

# 3.2 Telecommand Packet Definition

## 3.2.1 Function Management

## 3.2.1.1 Perform an Activity of a Function (Service 8,4)

The TFTS server is a multi-threaded application; it can handle two concurrent executing telecommands, not including the abort telecommand, which can override everything (except itself). The following rules determine what telecommands can run concurrently with others:

- No two identical commands can run simultaneously (including abort).
- Abort can override one or two concurrently running telecommands (except itself).
- If two telecommands are executing, a third telecommand is not allowed to run.
- The connection\_test telecommand can run concurrently with home\_TFTS, move\_table, and perform\_scan.
- Truncate\_scan can run concurrently with perform\_scan.
- All other combinations are illegal.

When an illegal telecommand request occurs, the TFTS responds with a Telecommand Acceptance Report – Failure TM(1,2), with error code TFTS\_BUSY (value = 16).

All command packets of this type and subtype may give rise to the following Errors:

| Error               | TM<br>Service | Error Code | Description           |
|---------------------|---------------|------------|-----------------------|
| Illegal_Function_ID | (1, 2)        | 0x0801     | Function ID not known |
| Illegal_Activity_ID | (1, 2)        | 0x0802     | Activity ID not known |

#### 3.2.1.1.1 Function: Set Observation ID

This command sets the value for the Observation ID, which is included in all telemetry packets to allow them to be ingested into the HCSS database.

| 0 | 0     | 0          | 1   | 1          |    | APID |    |       |   |    |   |    |    |   |   |
|---|-------|------------|-----|------------|----|------|----|-------|---|----|---|----|----|---|---|
| 1 | 1     | <b>U</b> 1 | Sro | С          |    |      |    | Count |   |    |   |    |    |   |   |
|   |       |            |     |            | Le | en   | gt | h :   | = | 11 |   |    |    |   |   |
| 0 | 0     | 0          | 0   | 0          | 0  | 0    | 1  | 0     | 0 | 0  | 0 | 1  | 0  | 0 | 0 |
| 0 | 0     | 0          | 0   | 0          | 1  | 0    | 0  | 0     | 0 | 0  | 0 | 0  | 0  | 0 | 0 |
| F | UI    | N(         | CT  | <u>]</u> [ | IC | NI.  | D  | A     | C | ΓI | V | IΊ | Ϋ́ | Π | ) |
|   | OBSID |            |     |            |    |      |    |       |   |    |   |    |    |   |   |
|   |       |            |     |            |    |      |    |       |   |    |   |    |    |   |   |
|   |       |            |     |            |    | (    | CF | 20    | 7 |    |   |    |    |   |   |

| Parameter  | Value and Comments      | Size (bytes) |
|------------|-------------------------|--------------|
| FUNCTIONID | 0xC1                    | 1            |
| ACTIVITYID | 0x01                    | 1            |
| OBSID      | Observation ID          | 4            |
| CRC        | Cyclic Redundancy Check | 2            |

**SPIRE Test Facility FTS Data ICD** 

#### 3.2.1.1.2 Function: Set Building Block ID

This command sets the value for the Building Block ID, which is included in all telemetry packets to allow them to be ingested into the HCSS database.

| 0 | 0             | 0     | 1  | 1        |    | APID |    |    |    |    |   |    |    |   |   |
|---|---------------|-------|----|----------|----|------|----|----|----|----|---|----|----|---|---|
| 1 | 1             | l Src |    |          |    |      | C  | ou | nt | -  |   |    |    |   |   |
|   | Length $= 11$ |       |    |          |    |      |    |    |    |    |   |    |    |   |   |
| 0 | 0             | 0     | 0  | 0        | 0  | 0    | 1  | 0  | 0  | 0  | 0 | 1  | 0  | 0 | 0 |
| 0 | 0             | 0     | 0  | 0        | 1  | 0    | 0  | 0  | 0  | 0  | 0 | 0  | 0  | 0 | 0 |
| F | UI            | N(    | СТ | <u> </u> | IC | N    | D  | A  | C  | ΤI | V | IΤ | Ϋ́ | Π | ) |
|   | BBID          |       |    |          |    |      |    |    |    |    |   |    |    |   |   |
|   |               |       |    |          |    |      |    |    |    |    |   |    |    |   |   |
|   |               |       |    |          |    | (    | CF | 2  | 2  |    |   |    |    |   |   |

| Parameter  | Value and Comments      | Size (bytes) |
|------------|-------------------------|--------------|
| FUNCTIONID | 0xC1                    | 1            |
| ACTIVITYID | 0x02                    | 1            |
| BBID       | Building Block ID       | 4            |
| CRC        | Cyclic Redundancy Check | 2            |

#### 3.2.1.1.3 Function: Reset TFTS

This command performs the selected type of reset on the TFTS. Type 0x0001 resets the TFTS system: the U500, DPU counter, network communications, and TFTS software state (IDLE = listen for new TC commands). Type 0x0002 performs a hardware-level reset on the U500 device, while type 0x0004 performs a software-level reset on the U500 device, while type 0x0004 performs a software-level reset on the Undex 500 only. Typically, only the type 0x0001 reset will needed to be performed; the other two types are available for system troubleshooting. Upon reset, the TASK\_STATUS field of the TM(3,25) Housekeeping Report is set to IDLE.

#### 3.2.1.1.4 Function: Home TFTS Stage

This command instructs the TFTS to send the stage on a "homing cycle" (where the stage finds the centre calibration marker), then moves the stage to a default starting position - a position from which all scans start from. This point can be any position on the table, and is defined by setting a Unidex 500 parameter.

#### 3.2.1.1.5 Function: Reset Table After Limit Fault

If the stage has moved beyond the acceptable CW (top of table) and CCW (bottom of table) limits of the table (which is triggered by optical switches in the table), the U500 signals this error and halts the table, disallowing any further motion commands until the stage is moved back into the safe region of the table (between the optical limit switches). This command calls the U500 command to move the stage into the safe region, reset the U500 card, and perform a homing cycle, which moves the stage back into starting position. Confirmation that the limit error has been cleared is shown in the U500\_HW\_STATUS field, contained in the TM(3,25) Housekeeping packet.

#### 3.2.1.1.6 Function: Move Table

Move the Aerotech stage a defined distance, direction, velocity and acceleration. Acceleration is an optional parameter, and refers to the maximum allowable acceleration of the table. The distance is relative to its initial position. Therefore, it may be necessary to read the stage's position before invoking the move command. Typical values for these parameters are described in the <u>TFTS Users Manual</u>.

#### 3.2.1.1.9 Function: Perform Scan

The response to this telecommand is the <u>Nominal Science Report</u>. A scan involves going "down" some distance, then back "up" the equivalent distance. One can request the TFTS to perform 1 or more scans. Multiple scans can be interrupted by issuing the truncate\_scan or abort\_scan telecommands. Scans start at some user-definable starting position, which by default is the top (position 0) of the stage. Please refer to the <u>TFTS Users Manual</u>.

#### 3.2.1.1.10 Function: Run Unidex 500 Script

Execute a sequence of events on the Unidex 500. Is analogous to running a script. Only one script can run at a time. It is used for TFTS configuration and troubleshooting (particularly during set-up of the TFTS system), and likely will not be used during normal operation of the TFTS.

#### 3.2.1.1.11 Function: Abort Scan

Halt the Aerotech stage and feed back any collected data in Nominal Science Report packets TM(21,1). The stage is left at the position it was halted at. A subsequent command (such as home or move\_stage) will be necessary to reset the stage to some starting position. An abort sets the TASK\_STATUS field of the TM(3,25) Housekeeping Report to ABORT.

| CRC        | Cyclic Redundancy Check | 2            |

#### 3.2.1.1.12 Function: Truncate Scan

While performing a batch of multiple scans, do not perform any further scans after the currently running one. In other words, truncate the current multiple-scan session. This command does not halt the stage – the stage returns to its starting position upon conclusion of its currently running scan.

## 3.2.2 Test Service

## 3.2.2.1 Perform Connection Test (Service 17,1)

This telecommand requests the TFTS to echo back the <u>Link Connection Report</u> packet. This test is used to determine if the EGSE network connection is up.

# 4 **TELEMETRY PACKETS**

This section defines all the TM packets that will be produced by the TFTS.

# 4.1 Telemetry Packet Types

The Packet Structure ICD (AD01) defines many types of service that can be provided by an Application. The following table shows the telemetry packet types that will be produced by the TFTS.

| Description                                | Service<br>Type | Service<br>Sub-Type | Comments  |
|--|-----------------|---------------------|-----------|
| Telecommand Verification Service           | Type            | Sub-1ypc            |           |
| Telecommand Accentance Report - Success    | 1               | 1                   |           |
| Telecommand Acceptance Report - Success    | 1               | 2                   |           |
| Telecommand Execution Report - Started     | 1               | 3                   |           |
| Telecommand Execution Report - Progress    | 1               | 5                   |           |
| Telecommand Execution Report - Completed   | 1               | 7                   |           |
| Telecommand Execution Report - Failure     | 1               | 8                   |           |

**Table 6: Telemetry Packet Definitions** 

#### **Telemetry Packet Definitions**

### 4.1.1 TC Verification Service

### 4.1.1.1 Telecommand Acceptance Report - Success (1,1)

Upon receipt of a telecommand, the TFTS will send this packet to the EGSE (the TC sender) if there are no errors detected. The errors are listed in the packet control error table shown below.

| 0 | 0                          | 0 | 0     | 1 |   |   |    |    | A | ΡI | D |   |   |   |   |

### 4.1.1.2 Telecommand Acceptance Report - Failure (1,2)

If errors are detected in the telecommand (sent by the EGSE to the TFTS), the TFTS will respond with this packet. Two additional data fields, the Failure Code and Parameter fields, describe the type of error experienced. The structure of this packet depends on the type of error found in the telecommand.

#### 4.1.1.2.1 Packet Control Errors

The following TM packet is returned if FAILURE CODE 0 through 4 is encountered.

| 0 | 0            | 0 | 0               | 1  |    |    |     |     | A  | ΡI  | D |    |    |     |    |
|---|--------------|---|-----------------|----|----|----|-----|-----|----|-----|---|----|----|-----|----|

Note: The parameter is placed in the least significant bits of the 16 bit 'parameter' field and the most significant bits are padded with zeros

# Packet Content Error (continued)

A TM packet in the form shown below is what would be returned if FAILURE\_CODE = 5, or codes 16 through 255 are encountered.

| 0                    | 0             | 0  | 0              | 1  |    |   |     |    | A  | ΡI  | D  |   |    |     |    |

# 4.1.1.6 Telecommand Execution Report – Failed (1,8)

This telemetry packet is sent to alert the EGSE that the requested telecommand has failed. An explanation of the failure can be derived from the TC Source Data Field, or by examining the U500\_HW\_STATUS and U500\_SW\_STATUS field of the Housekeeping Report packet.

| 0 | 0                          | 0 | 0 | 1 |    |    |      |            | A   | ΡI | D |   |   |   |   |

# 4.1.2 Device Command Distribution

Not Applicable.

### 4.1.3 Housekeeping and Diagnostic Data Reporting

### 4.1.3.1 Housekeeping Parameter Report (Service 3,25)

The general packet structure is shown below. The Structure ID identifies the housekeeping packet type. Housekeeping telemetry packets are sent continuously (one packet per second) while the TFTS server is operating.

| 0           | 0 | 0 | 0              | 1 |   |    |    |    | A  | ΡI | D |   |   |   |   |

| 0x0301                | Nominal Housekeeping Report | 1000                        |

## 4.1.3.2 Nominal Housekeeping Report (SID=0x0301)

The following table lists the fields that comprise the housekeeping packet's parameters block.

| Parameter Name      |                      | Description                                      | Size (bytes) |  |  |  |  |  |  |
|---------------------|----------------------|--|--------------|--|--|--|--|--|--|
| OBSID               | Observation ID       |  | 4            |  |  |  |  |  |  |
| BBID                | Building Block ID    |  | 4            |  |  |  |  |  |  |
| ITERATIONS          | Number of scans to   | perform in a scan sequence                       | 2            |  |  |  |  |  |  |
| CURR_ITERATION      | Current scan iterati | on being executed                                | 2            |  |  |  |  |  |  |
| CURR_VELOCITY       | Current velocity of  | stage  | 4            |  |  |  |  |  |  |
| CURR_ACCELERATION   | Current acceleration | n of stage (not in use)                          | 4            |  |  |  |  |  |  |
| CURR_SAMP_INTERVAL  | Requested sampling   | g interval of current scan iteration             | 4            |  |  |  |  |  |  |
| CURR_DISTANCE       | Requested scan dist  | tance of current scan iteration                  | 4            |  |  |  |  |  |  |
| CURR_POSITION       | Current position of  | urrent position of stage                         |              |  |  |  |  |  |  |
| DPU_CNTR_RESET_TIME | Time the DPU cour    | ime the DPU counter was last reset (coarse time) |              |  |  |  |  |  |  |
| NUM_TC              | Number of telecom    | 4  |              |  |  |  |  |  |  |
| NUM_TM              | Number of telemetr   | 4  |              |  |  |  |  |  |  |
| DIRECTION           | Stage movement di    | 2  |              |  |  |  |  |  |  |
|                     | UP                   | 0x0000   |              |  |  |  |  |  |  |
|                     | DOWN                 | 0x0001   |              |  |  |  |  |  |  |
|                     | NO_DIRECTION         | 0x0002   |              |  |  |  |  |  |  |
| TASK_STATUS         | TFTS software stat   | e  | 2            |  |  |  |  |  |  |
|                     | IDLE                 | 0x0000   |              |  |  |  |  |  |  |
|                     | SCANNING             | 0x0001   |              |  |  |  |  |  |  |
|                     | ABORT                | 0x0002   |              |  |  |  |  |  |  |
|                     | ERROR                | 0x0004   |              |  |  |  |  |  |  |
| U500_HW_STATUS      | State of Unidex 500  | 0 hardware                                       | 4            |  |  |  |  |  |  |
| U500_SW_STATUS      | State of Unidex 500  | 0 software (device driver)                       | 4            |  |  |  |  |  |  |

# SPIRE Test Facility FTS Data ICD

Ref:SPIRE-UoL-PRJ-<br/>001452Issue:Version 1.2bDate:July 7, 2003Page:32

The following table lists all possible Unidex 500 software errors that can be generated. Only some errors listed below will be generated during operation of the TFTS. This table is provided for reference.

| Error Code | Description   |
|------------|---|
| 0x0000000  | Command OK  |
| 0xE0021000 | (DRV) Function no longer supported                                    |
| 0xE0021001 | (DRV) Timeout waiting to read data from U500                          |
| 0xE0021002 | (DRV) Timeout waiting to write data to U500                           |
| 0xE0021003 | (DRV) Timeout waiting for command vector acknowledge                  |
| 0xE0021004 | (DRV) Board Checksum Feedback Error                                   |
| 0xE0021005 | (DRV) System download communication error                             |
| 0xE0021006 | (DRV) Command not taken out of buffer (HF2 = 1)                       |
| 0xE0021007 | (DRV) DSP Read Timeout1   |
| 0xE0021008 | (DRV) DSP Read Timeout2   |
| 0xE002100A | (DRV) QuickStat: Timeout waiting for previous command vector to clear |
| 0xE002100B | (DRV) QuickStat: Timeout waiting for this command vector to clear     |
| 0xE002100C | (DRV) QuickStat: Timeout waiting for response to this command vector  |
| 0xE0021010 | (DRV) PSO Initialize Error  |
| 0xE0021011 | (DRV) PSO Not Initialized   |
| 0xE0022001 | Out of Memory   |
| 0xE0022003 | Invalid Firmware file   |
| 0xE0022004 | Invalid Parameter file  |
| 0xE0022005 | Invalid Plane   |
| 0xE0022006 | Invalid Axis  |
| 0xE0022007 | Invalid Parameter   |
| 0xE0022008 | Invalid K value   |
| 0xE0022009 | Invalid Scale value   |
| 0xE002200A | Invalid N/D value   |
| 0xE002200B | Invalid Notch value   |
| 0xE002200C | Invalid Deadband value  |
| 0xE002200D | Invalid Clamp value   |
| 0xE002200E | Invalid Flag  |
| 0xE002200F | Axis not enabled  |
| 0xE0022010 | Circle Format Error   |
| 0xE0022011 | Voltage Out of Range  |
| 0xE0022012 | U500 Plus required  |
| 0xE0022014 | PSO not initialized   |
| 0xE0022015 | Axis not defined in this Plane  |
| 0xE0022016 | CRC radius not defined  |
| 0xE0022017 | CRC Axes not defined  |
| 0xE0022018 | CRC Buffer full   |
| 0xE0022019 | U500 Ultra required   |
| 0xE002201B | PSO Mailbox full  |
| 0xE002201C | Invalid Calibration file  |
| 0xE002201D | Feedrate is ZERO  |
| 0xE002201E | Invalid parameter number  |
| 0xE0022020 | Calibration file format error   |
| 0xE0022021 | Argument too large  |
| 0xE0022022 | Incorrect gate array configuration                                    |
| 0xE0022023 | PSO command not supported   |
| 0xE0022024 | Invalid argument  |
| 0xE0022028 | Invalid axis specified  |

Table 9: Unidex 500 Software Errors

# 4.1.3.3 Exception Report (5,2)

If an error occurs during the execution of a telecommand, the TFTS sends an Exception Report TM(5,2) with its EVENT\_ID field set to the kind of error encountered. This is followed by a Telecommand Execution Report – Failure packet. Reasons for the failure can also be derived from fields in the stream of Housekeeping packets.

#### 4.1.3.3.1 DPU Counter Error

This packet is generated in the event of the TFTS control software receiving an error from the DPU counter hardware.

SPIRE Test Facility FTS Data ICD

#### 4.1.3.3.2 Unidex 500 Error: Limit Error and Feedback Error

This packet is generated in the event of the TFTS control software receiving an error from the Unidex 500.Other ErrorEVENT\_ID = 0x0001Limit ErrorEVENT\_ID = 0x0004Feedback ErrorEVENT\_ID = 0x0008

Other Error is any error that's neither a Limit error, Feedback error or DPU error. It could be U500 or Windows operating system related. U500 software errors (due to faulty Unidex function calls) throw this kind of exception.

| CRC       | Cyclic Redundancy Check    | 2            |

This function is analogous to a "ping" command used to test TCP/IP connections. When the TFTS receives a <u>Perform Connection Test</u> telecommand, it responds by sending this telemetry packet.

**SPIRE Test Facility FTS Data ICD** 

### 4.1.5 Science Data

# 4.1.5.1 Nominal Science Report (Service 21, 1)

This telemetry represents the data returned from a scan, and can consist of one or more Nominal Science Report packets.

|   |                   |    |        |    |            | (        | CF      | 20      | 2                      |          |        |         |     |   |   |

The data fields DPU\_COUNTER\_TIME and SAMPLE\_POS (in grey) represent a single sample tuple. It repeats the number of times defined in NUM\_DATAPTS. In the above example, NUM\_DATAPTS = 3.

| Parameter        | Comment                         | Size    |

| CRC              | Cyclic Redundancy Check.        | 2       |

**NOTE**: This report returns multiple (segmented) variable length data packets to the EGSE, and is the response to the <u>Acquire Single-Sided</u> <u>Interferogram Scan</u> function. The segmentation flag is set to 11. Since telemetry packet cannot be larger than 1024 bytes, and the non-data portion of this packet is 38 bytes large, there are **986** bytes available for data (8 byte time-position pairs). **1** to **123** time-position pairs can be stored. If the data set contains more than 123 data samples, the data set will be spanned across multiple Nominal Science Report packets. Packets with less than the maximum allowable data points are truncated. The length field is adjusted to reflect the size of truncated packets.

## 4.1.5.2 Diagnostic Science Report (Service 21, 3)

#### 4.1.5.2.1 Diagnostic Science Report – Unidex 500 Parameter Report (SID=0x0002)

This telemetry packet contains a Unidex 500 parameter, as requested by the telecommand <u>Read Unidex 500</u> <u>Parameter</u> telecommand.

## 5.1.1 Parameter Definition

| Parameter Name    | Service   | Туре     | Size   | Conversion        | Constraint       | Comments  |
|-------------------|-----------|----------|--------|-------------------|------------------|---|
|                   | Reference |          | (bits) | Curve             | Table            |   |
| ACTIVITYID        | (8,4)     | UINT     | 8      | None              | 0 to $2^8$ -1    | Defines activity to perform.                              |
| APID              | ALL       | UINT     | 11     | None              | 0x7F5            | Application ID.   |
| CRC               | ALL       | UINT     | 16     | None              | 0 to $2^{16}$ -1 | Cyclic Redundancy Check.                                  |
| OBSID             | (8,4)     | UINT     | 32     | None              | 0 to $2^{32}$ -1 | Observation ID  |
| BBID              | (8,4)     | UINT     | 32     | None              |                  | Building Block ID: Field is split into 3 parts            |
| BBINTR            |           | constant | 2      |                   | 0 to 3           | Location: Bits 0-1 Value:2                                |
| BBTYPE            |           | UINT     | 14     |                   | 0 to $2^{14}$ -1 | Location: Bits 2-15                                       |
| BBCOUNT           |           | UINT     | 16     |                   | 0 to $2^{16}$ -1 | Location: Bits 16-31                                      |
| FUNCTIONID        | (8,4)     | UINT     | 8      | None              | 0 to $2^{8}$ -1  | Defines activity to perform.                              |
| Length            | ALL       | UINT     | 16     | None              | 0 to $2^{16}$ -1 | Number of bytes contained in packet data field.           |
| DISTANCE          | (8,4)     | UINT     | 32     | 10  nm = 1        | 0 to             | Distance the Aerotech stage travels.                      |
|                   |           |          |        | unidex unit (uu)  | 20,000,000       |   |
| DIRECTION         | (8,4)     | UINT     | 16     | None              | 0, 1             | Direction that Aerotech stage travels: UP=0, DOWN=1       |
| VELOCITY          | (8,4)     | UINT     | 32     | uu/s              | 4 to             | Velocity at which Aerotech stage travels.                 |
|                   |           |          |        |                   | 32,767,000       |   |
| ACCELERATION      | (8,4)     | UINT     | 32     | uu/s <sup>2</sup> | 4000 to          | Acceleration at which Aerotech stage performs movement.   |
|                   |           |          |        |                   | 255,000,000      |   |
| ITERATIONS        | (8,4)     | UINT     | 16     | None              | 0 to $2^{16}$ -1 | Number of scans to perform in a scan sequence.            |
| SAMPLING_INTERVAL | (8,4)     | UINT     | 32     | uu                | 1 to             | Distance interval in which to repeatedly take DPU time    |
|                   |           |          |        |                   | 8,388,607        | samples.  |
| PARAM_NUM         | (8,4)     | UINT     | 16     | None              | 1 to 501,        | Unidex 500 parameter ID number to read/modify             |
| COMMENTS          | (8,4)     | char     | 80*8   | None              | max 80 ASCII     | Comments that describe a particular scan – contains ASCII |
|                   |           |          |        |                   | characters       | text. Unused space is zero-filled.                        |
|                   |           |          |        |                   |                  | ·   |

# 5.2 TM Parameters

## 5.2.1 Parameter Definition

| Name               | Length | Туре | Conversi          | Limits           | Description   |
|--------------------|--------|------|-------------------|------------------|---|
|                    | (bits) |      | on                |                  |   |
| NUM_TC             | 32     | UINT | None              | 0 to $2^{32}$ -1 | Number of telecommand packets received by the TFTS.               |
| NUM_TM             | 32     | UINT | None              | 0 to $2^{32}$ -1 | Number of telemetry packets sent by the TFTS.                     |
| DIRECTION          | 16     | UINT | None              | 0, 1             | Direction of travel of the Aerotech table: UP=0, DOWN=1,          |
|                    |        |      |                   |                  | NO_DIRECTION = 2 (when stage is not moving)                       |
| TASK_STATUS        | 16     | UINT | None              | 0, 1, 2, 4       | State of TFTS software – running a scan / initialization, waiting |
|                    |        |      |                   |                  | for commands, or error.   |
| U500_HW_STATUS     | 32     | UINT | None              | 0 to $2^{32}$ -1 | Status word of Unidex 500. This value describes the state of the  |
|                    |        |      |                   |                  | hardware of the Unidex 500.                                       |
| U500_SW_STATUS     | 32     | UINT | None              | 0 to $2^{32}$ -1 | Reports device driver errors and state of the Unidex 500 control  |
|                    |        |      |                   |                  | software.   |
| CURR_VELOCITY      | 32     | INT  | uu/s              | +/- 32,767,000   | Current velocity of stage (can be positive or negative).          |
| CURR_ACCELERATION  | 32     | UINT | uu/s <sup>2</sup> | 4000 to          | Current acceleration of stage (not reported)                      |
|                    |        |      |                   | 255,000,000      |   |
| CURR_SAMP_INTERVAL | 32     | UINT | uu                | 1 to 8,388,607   | Requested sampling interval of current scan iteration.            |
| CURR_DISTANCE      | 32     | UINT | uu                | 0 to 20,000,000  | Requested scan distance of current scan iteration.                |
| CURR_POSITION      | 32     | INT  | uu                | +/- 20,000,000   | Current position of stage (can be positive or negative)           |
| EVENTID            | 16     | UINT | None              | 0 to $2^{32}$ -1 | Type of exception raised by TFTS.                                 |
| DPU_COUNTER_TIME   | 32     | UINT | Counter           | 0 to $2^{32}$ -1 | DPU counter value – driven by 315 kHz DPU clock signal            |
|                    |        |      | increments        |                  |   |

| U500_PARAMETER     | 8 * 48 | Char | None     | Max 48 ASCII                        | Value of requested Unidex 500 parameter – returned as a NULL                 |
|--------------------|--------|------|----------|-------------------------------------|--|
|                    |        |      |          | characters                          | terminated ASCII string.   |
| DATATYPE           | 16     | UINT | None     | 1, 2, 4                             | Datatype of requested Unidex parameter – defines how the                     |
|                    |        |      |          |                                     | parameter should be interpreted.   |
| APID               | 11     | UINT | None     | 0x7F5                               | Application ID.  |
| CRC                | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Cyclic Redundancy Check.   |
| Length             | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Number of bytes in telemetry packet's data field.                            |
| Count              | 14     | UINT | None     | 0 to $2^{14}$ -1                    | Telemetry packet sequence number.  |
| TIME               | 48     | UINT | Seconds  | 0 to $2^{32}$ -1                    | Time that the telemetry packet was created.                                  |
| FAILURE_CODE       | 16     | UINT | None     | TBD                                 | Reasons for failure of acceptance of a telecommand.                          |
| TC_PACKET_APID     | 16     | UINT | None     | 0x7F5                               | A failure code: APID of TM's corresponding TC.                               |
| TC_PACKET_LENGTH   | 16     | UINT | Number   | 5 to 1017                           | A failure code: Length data field of TM's corresponding TC.                  |
|                    |        |      | of bytes | (no packet greater than 1024 bytes) |  |
| TC_PACKET_CRC      | 16     | UINT | None     | 0 to $2^{16}$ -1                    | A failure code: CRC value of TM's corresponding TC.                          |
| TC_PACKET_TYPE     | 8      | Char | None     | 0 to $2^8$ -1                       | A failure code: TC packet type of TM's corresponding TC.                     |
| TC_PACKET_SUBTYPE  | 8      | Char | None     | 0 to $2^8$ -1                       | A failure code: TC packet sub-type of TM's corresponding TC.                 |
| TC Packet Sequence | 16     | UINT | None     | 0 to $2^{16}$ -1                    | A copy of the TC packet header sequence control bytes (17 <sup>th</sup> thru |
| Control            |        |      |          |                                     | $32^{nd}$ bit) to which this TM replies.                                     |
| TC_Packet_ID       | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Telecommand Packet ID: copy of the corresponding field from                  |
|                    |        |      |          |                                     | the packet header of the TC to which this TM replies.                        |
| SID                | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Structure ID   |
| OBSID              | 32     | UINT | None     | 0 to $2^{32}$ -1                    | Observation ID (facilitates telemetry to be ingested into HCSS               |
|                    |        |      |          |                                     | database).   |
| BBID               | 32     | UINT | None     | 0 to $2^{32}$ -1                    | Building Block ID (facilitates telemetry to be ingested into HCSS            |
|                    |        |      |          |                                     | database).   |
| ITERATIONS         | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Number of scans to perform in a scan sequence.                               |
| CURR_ITERATION     | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Current iteration in scan being executed.                                    |
| DPU_COUNTER_ERR    | 16     | UINT | None     | 1,2,4,8                             | Identity of DPU counter error.   |
| TOT_PACKETS        | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Number of packets in a scan.   |
| CURR_PACKET        | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Current packet number (out of a total of n packets).                         |
| NUM_DATAPOINTS     | 16     | UINT | None     | 0 to $2^{16}$ -1                    | Number of data points in the current Nominal Science Report TM               |
|                    |        |      |          |                                     | packet.  |
| SAMPLE_POS         | 32     | UINT | None     | 0 to $2^{32}$ -1                    | Position of the Aerotech stage at a given time.                              |
| STEP_NUMBER        | 16     | UINT | None     | 0 to $2^{16}$ -1                    | The stage of execution in a currently running scan.                          |
