1. SCOPE

The aim of the present document is to provide a detailed test report of HSO/First-DPU BASIC S/W to be installed on the Data Processing Units developed in the framework of the HSO/FIRST program.

The test to be performed according to the Test Procedure as defined in [AD 6] are to demonstrate the compliance of the above item to the requirements specified in the applicable document [AD 7] as part of the overall verification program.

4. PARTICIPANTS REQUIRED

4.1 GENERAL

All test will be performed under QA surveillance in accordance with, and following detailed procedure of applicable PA Plan. Start of the Test shall be notified to Prime Contractor and/or Customer as applicable.

4.2 RESPONSIBILITY

The technical responsibility for testing and test results is up to the Software department.

QA is responsible for ensuring that all the agreed procedures are carefully observed, that test equipment and instrumentation used during testing is calibrated and within validity date: that the test data sheets are recorded in the Test Report and signed by the operators and QA witnesses, that all non conforming condition and test results are properly documented and notified to the Prime Contractor, and that all requirements of applicable PA Plan, specification and Statement of Work pertaining to the acceptance tests, are fully satisfied.

4.3 QA WITNESS OF TEST AND SIGN-OFF

QA inspector, or its delegate, shall witness the tests described in this procedure for the EM model in accordance to the requirement specified in the applicable PA Plans. For the EM QA or its delegate will check the test report sheets only.

 CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU		N° Doc: DPU-RP-CGS-030 Doc N°:

5. TEST ARTICLE

The test article consists of the HSO/DPU FIRST BASIC SW. It is composed of the following items

- BOOT SW
- DRIVERS SW
 - 1355 Drivers
 - 1553 Drivers
 - Watchdog Drivers
 - EEPROM Drivers

5.1 ITEMS DESCRIPTION

The BOOT SW is that will be resident in the PROM memory and it will allow the copy of the EEPROM program in Program Memory for the execution. The program is able to detect Data memory errors, Program memory errors, EEPROM memory errors, Application Program instruction errors by means of the Frame Check sequence checking. The Program signals the errors by means of the MIL-STD-1553 sending a Telemetry Packet to Computer Data management System according to the [AD 6] document. The BOOT SW program allows to upload a new version of the "Application Program" from Computer Data Management System via MIL-STD-1553. The CMDS will send adequate TC in order to upload the Data Memory of the Board and then it will move all the page in Program memory adjusting the Instruction parallelism.

The 1355 Drivers allow to command the Spacewire interface. A suite of the basic (Data Link layer) and High level (Transport Layer) functions are provided in order to allow an easy interface to the Application Software.

The 1553 Drivers allow to program and command the DDC chip for the MIL-STD-1553 management. A suite of elementary and High level function is provided in order to allow an easy interface to the Application Software. The users can choose the level more adequate interfacing the Application Software.

The Watchdog Drivers allow to command the Watchdog. Essential functions are provided in order to program the watchdog board.

The EEPROM Drivers allow to read and write the EEPROM. High level functions are provided for programming the EEPROM. The EEPROM is shared in page and the first 7 words of each page are reserved for page Header. Each page contains the PM check sequence and DM check sequence. When a cell of the page is written the FCS are automatically computed. The EEPROM Drives includes a high level function which allows to transfer a program in Program memory in EEPROM specifying the start address and the end address. The Interrupt vectors table is automatically included.

6. TEST CONFIGURATION

The following picture shows the Test environment configuration (figure 6-1).

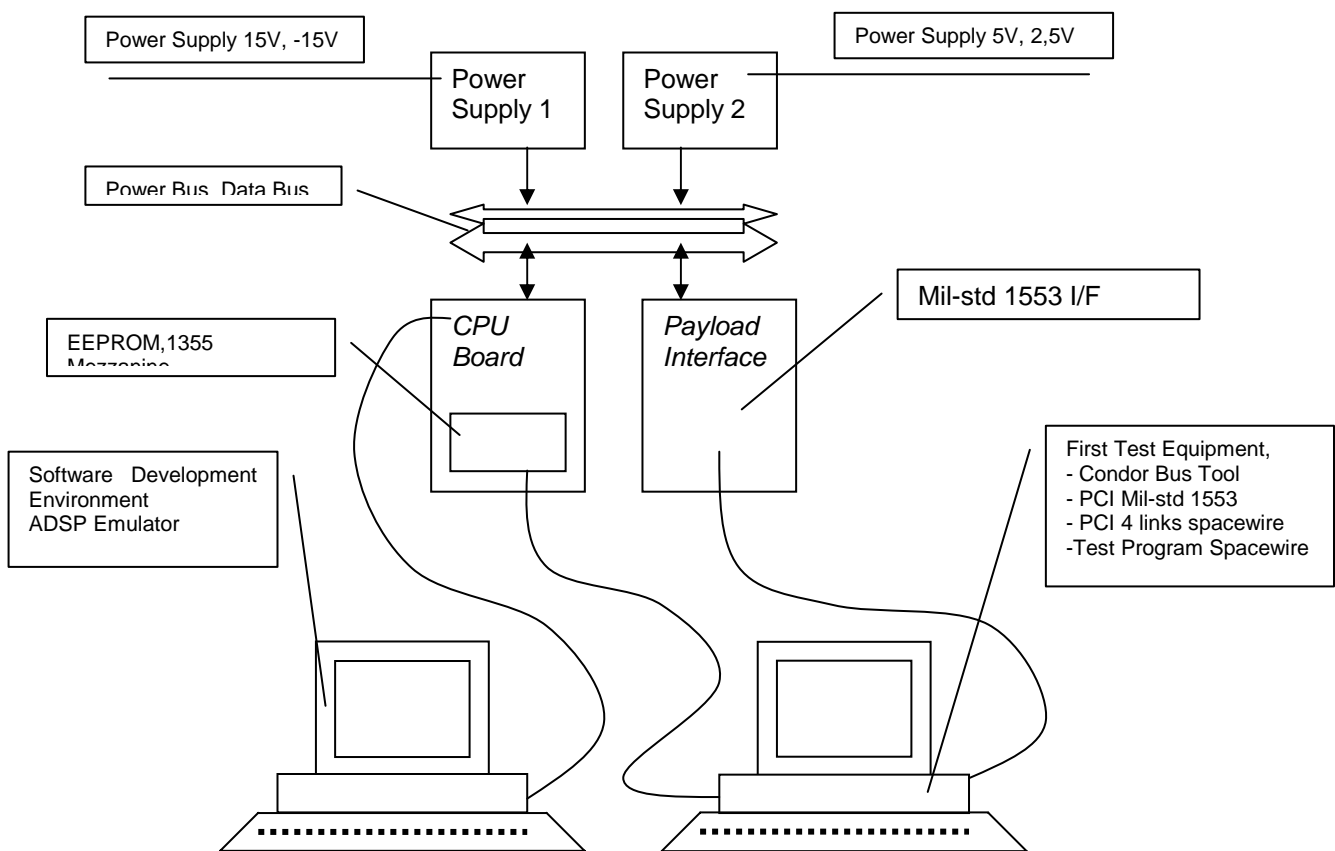

figure 6-1: Test Configuration Environment

7. INSTRUMENTATION AND TEST EQUIPMENT

The complete list of the instrumentation used during the test shall be recorded in table (table 7-1).

N.	EQUIPMENT
1	Power Supply 2 outputs (5V, 2,5V)
2	Power Supply 2 outputs (15V, -15V)
3	ADSP Emulator
4	Personal Computer with ADSP 21020 SDE tool
5	Personal Computer with 1355 PCI board, 1553 PCI board and Test equipment tools
6	Cable connecting Mil-Std-1553
7	Cable connecting Spacewire interface

table 7-1: Instrumentation and Test Equipment Table

8. TEST PROCEDURES.

8.1 DPU BOOT SW TEST PROCEDURES.

8.1.1 BOOT SW TEST PROCEDURE.

Step	Test Procedure Identifier	TR-BOOTSW –010	Results	Remarks
	Purpose	Verify the uploading of an Application Program from EEPROM.		
	Special Requirement	For this operation is requested an Open Box condition to connect the DSP emulator.		
	Procedure steps			
1	Program the EEPROM mezzanine using the SW Test drivers. Dump the EEPROM contained from 0x80000000 to 0x800017ff. Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window. Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.		OK	
2	Perform a chip reset by emulator Start program Set breakpoint before of jumping to “Application Program” Verify that the program has been uploaded dumping the PM area from 0 to 0x100 cells and from 0x4000 to 0x4acc cell and comparing it with the instruction inside the EXE file.		OK	

 CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU	N° Doc: DPU-RP-CGS-030 Doc N°:

8.1.2 DM TEST PROCEDURE.

Step	Test Procedure Identifier	TR-BOOTSW –020	Results	Remarks
	Purpose	Verify DM errors detection during initialization		
	Special Requirement	For this operation is requested an Open Box condition to connect the DSP emulator.		
	Procedure steps			
1	Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window and Data Window Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.		OK	
2	Perform a chip reset by emulator Start program Set breakpoint before of reading the data from Data memory Write the 0xFFFFFFFF data in the DM cell Start program Verify that the Boot SW detects the DM error verifying that a TM error message is sent to the FIRST TE containing the incorrect DM page address.		OK	
3	Verify that the BOOT SW is waiting a TC from FIRST TE checking that the "Application Program" has not been also uploaded (from 0x4000 to 0x4acc the PM contains spurious data)		OK	
Date 28/04/2002		Test Conductor A. Bertoli	P. Assurance S. Legramandi

8.1.3 PM TEST PROCEDURE.

Step	Test Procedure Identifier	TR-BOOTSW –025	Results	Remarks
	Purpose	Verify possible PM error detection during initialization		
	Special Requirement	For this operation is requested an Open Box condition to connect the DSP emulator.		
	Procedure steps			
1	Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Detach the Emulator and reconnect in order to erase previous value in PM. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window and Data Window Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.		OK	
2	Perform a chip reset by emulator Start program Set breakpoint before of reading the data from Program memory Write the 0xFFFFFFFF data in the PM cell Start program Verify that the Boot SW detects the PM error verifying that a TM error message is sent to the FIRST TE containing the incorrect PM page address.		OK	
3	Verify that the BOOT SW is waiting a TC from FIRST TE checking that the “Application Program” has not been also uploaded (from 0x4000 to 0x4acc the PM contains spurious data)		OK

8.1.4 EEPROM TEST PROCEDURE.

Step	Test Procedure Identifier	TR-BOOTSW –030	Results	Remarks
	Purpose	Verify that the “Application Software” is uploaded when an error in the first partition is found.		
	Special Requirement	For this operation is requested an Open Box condition to connect the DSP emulator.		
	Procedure steps			
1	Program the EEPROM mezzanine using the SW Test drivers. Dump the EEPROM contained from 0x80000000 to 0x800017ff. Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Detach the Emulator and reconnect in order to erase previous value in PM. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window and Data Window Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.		OK	
2	Perform a chip reset by emulator Read the value at the EEPROM address 0x80000020 Write a different value (i.e 0xFFFFAAAA) at the EEPROM address 0x80000020 Set a break point before of jumping to the “Application Program” execution. Start program Verify that the program has been uploaded, dumping the PM area from 0 to 0x100 cells and from 0x4000 to 0x4acc cell and comparing it with the instruction inside the EXE file.		OK	

 CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU	N° Doc: DPU-RP-CGS-030 Doc N°:
	HSO/FIRST DPU BASIC S/W TEST REPORT	Ediz.: 1 Data: 5/04/2002 Issue: Date:
		Pagina 23 di 92 Page of

3	Set a new breakpoint before of reprogramming the EEPROM Start the program Verify that the EEPROM has been cleaned and the first six pages are blanks.	OK	
4	Start the program Wait until the end of program Verify that the program has been correctly performed comparing the new programmed EEPROM with the values previously dumped Verify that the values 0xFFFFAAAA at the 0x80000020 is equal to the value read at step 2	OK	
5	Restart the system (power off) Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Detach the Emulator and reconnect in order to erase previous value in PM. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window and Data Window Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.	OK	
6	Perform a chip reset by emulator Read the value at the EEPROM address 0x8003fc20 Write a different value (i.e 0xFFFFAAAA) at the EEPROM address 0x8003fc20 Set a break point before of jumping to the "Application Program" execution. Start program Verify that the program has been uploaded, dumping the PM area from 0 to 0x100 cells and from 0x4000 to 0x4acc cell and comparing it with the instruction inside the EXE file.	OK	

 CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU	N° Doc: DPU-RP-CGS-030 Doc N°:	Ediz.: 1 Issue:	Data: 5/04/2002 Date:

8.1.5 EEPROM TO PM LOAD TEST PROCEDURE.

Step	Test Procedure Identifier	TR-BOOTSW -040	Results	Remarks
	Purpose	Verify an error is detected during the uploading of an Application Program from EEPROM to PM.		
	Special Requirement	For this operation is requested an Open Box condition to connect the DSP emulator.		
Procedure steps				
1	Program the EEPROM mezzanine using the SW Test drivers Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window. Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.		OK	
2	Perform a chip reset by emulator Set breakpoint before of starting the EEPROM to PM upload Start program No checks is requested		OK	
3	Write at the EEPROM address 0x80000820 the value 0xFFFFFFFF Stat program Stop program and Verify that a TM error message is sent by means of MIL1553 to FIRST TE indicating the failed PM page upload. Verify that the "Application Program" has been partially uploaded: page 1,2 are ok page 3 is failed checking the PM content.		OK	
Date 28/04/2002		Test Conductor A. Bertoli	P. Assurance S. Legramandi	

 CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU	N° Doc: DPU-RP-CGS-030 Doc N°:	Ediz.: 1 Issue:	Data: 5/04/2002 Date:

8.1.6 DM TO PM LOAD TEST PROCEDURE.

Step	Test Procedure Identifier	TR-BOOTSW –050	Results	Remarks
	Purpose	Verify an error is detected during the uploading of an Application Program from DM to PM.		
	Special Requirement	For this operation is requested an Open Box condition to connect the DSP emulator.		
	Procedure steps			
1	Reset the EEPROM content Generate using Tcgen program the DM pages that will be uploaded Insert a programmed EPROM (FIRST DPU BOOT SW ver 2.0.) on the HSO/FIRST DPU board. Power On. Connect the ADSP Emulator Reset the Board. Open the Program Window and Data Window. Verify that the BOOTSW program has been uploaded in the first 1555 cells in program memory.		OK	
2	Perform a chip reset by emulator Upload the DM pages in Data Memory starting from 0x00004000 Set breakpoint before of the DM test Start program No check is required		OK	

 CARLO GAVAZZI CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU	N° Doc: DPU-RP-CGS-030 Doc N°:	Ediz.: 1 Issue:	Data: 5/04/2002 Date:
	HSO/FIRST DPU BASIC S/W TEST REPORT	Pagina 27 Page	di 92 of	

3	Change the value in the memory cell in order to fail the DM test Start the program Verify that a TM message is sent to FIRST TE	OK	
4	Send a TC in order to force the DM to PM program copy Set a breakpoint before of jumping to "Application Program" execution Verify that the "Application Program" is correctly copied at the following address: Pm 0x0 to 0x100 Pm 0x4000 to 0x4acc Dumping the PM content and comparing it with the Application program exe file	OK	
5	Start Program Verify that the EEPROM has been reprogrammed by means of the "Application Program" uploaded	OK

8.2 1355 DRIVER TEST PROCEDURE.

8.2.1 1355 POWER ON TEST PROCEDURE.

Step	Test Procedure Identifier	TR-DRV1355 -010	Results	Remarks
	Purpose	Verify the correct functioning of 1355 Power On.		
	Special Requirement	For this operation is requested the use of S/W Stub and Test Equipment		
	Procedure steps			
1	Power On. Load on Bus Tools Software the file Power-On.btd. Run on Bus Tools the network. Wait to receive the last packet from remote terminal. Off-line verification: Check in the log file Power-On-log.bmd the following: 1) at what function the packet answer are shown in ID field. 2) the success are shown in Error Code field. If Error Code is different from zero, the function is failed. To find error condition see Annex C. 3) the packet size is shown in third word of packet. For several information about the other packet's word see Annex A2.		OK

8.5 EEPROM DRIVER TEST PROCEDURE

8.5.1 DELETE EEPROM SEGMENT

Step	Test Procedure Identifier	TR-DRVEPRM -010	Results	Remarks
	Purpose	Deleting of EEPROM segment		
	Special Requirement	.		
	Procedure steps			
1	Upload the EEPROM test program using the ADSP emulator Set a breakpoint after a Delete Segment function call Write 10 times the 0xFFFFFFFF value beginning from the 0x80000000 address Start the program Verify (when the breakpoint is stricken) that the segment beginning at 0x80000000 until 0x800003FF address is cleaned		OK	
Date 28/04/2002		Test Conductor A. Bertoli	P. Assurance S. Legramandi

8.5.2 WRITE EEPROM CELL

Step	Test Procedure Identifier	TR-DRVEPRM -020	Results	Remarks
	Purpose	Write EEPROM single cell inside the segment		
	Special Requirement	.		
	Procedure steps			
1	Upload the EEPROM test program using the ADSP emulator Set a breakpoint after a write segment cell function call Start the program Verify (when the breakpoint is stricken) that the segment beginning at 0x80000C00 until 0x80000FFF address is written register the frame check sequence at the 0x80000C06 address and the value at 0x8000C17		OK	
2	Set a breakpoint after the "write eeprom cell" function call Start program Verify that the 0xFFFFFFFF value is written at 0x80000C17 address and the DM Frame Check Sequence and PM Frame Check Sequence are changed with respect to the previous value		OK	
3	Set a Breakpoint after the "write eeprom cell" function call The original value of the segment is written at 0x80000c17 address Start program Verify that the 0x00000010 value is written at 0x80000C17 Verify the DM Frame Check sequence and PM Frame sequence are the same of the step 1		OK	

 CARLO GAVAZZI CARLO GAVAZZI SPACE SpA	HSO/FIRST-DPU	N° Doc: DPU-RP-CGS-030 Doc N°:	Ediz.: 1 Issue:	Data: 5/04/2002 Date:
	HSO/FIRST DPU BASIC S/W TEST REPORT	Pagina 59 Page	di 92 of	

4	Set a breakpoint before the "write eeprom cell" function call which writes the value 0xFFFFFFFF at the 0x80000C06 Read the value in 0x80000c06 Start Program No check is required	OK	
5	Set breakpoint after the "write eeprom cell" function call Verify that the 0xFFFFFFFF is written at 0x80000c06 address; Verify that the DM frame check sequence is changed with respect to value reported in step 4 Verify that the PM check sequence is equal to the value reported in Step 4	OK	
6	Write the original value at the 0x80000C06 Verify that DM FCS is equal to value reported in step 4 Verify that PM FCS is equal to the value reported in step 4	OK
