## 1 Scope

### 1.1 Objective

This test report describes the results of the IMT performed for the Herschel SPIRE Instrument.

The test was performed at ASED in Ottobrunn from 26/09/2005 to 29/09/2005.

### 1.2 Summary

Detailed results are given in the as-run-procedure in Chapter 7

The following NCR's have been raised:

- HP-111000-ASED-NC-1513 – SPIRE EQM Cooler recycling (see Appendix 7)

The following NCR's have been altered:

- N/A

An overview can be found in chapter 12.2

### Conclusion:

The IMT was stopped after the third failed cooler recycle. An NCR is raised (ASED-NC-1513) to track his problem. The problem will be investigated and once solved, IMT will continue.

- HIFI\_prime\_inst.PST
- PACS\_SPIRE\_par.PST
- PACS\_burst\_mode.PST
- Inst\_sdby.PST

The profiles allow one instrument in PRIME mode, while the others are in standby mode. This test will use only the following bus profile(s):

- SPIRE\_prime\_inst.PST (see Appendix 1)

## 4.5 MIB

### 4.5.1 Version

The used MIB has reference: CCS\_Her\_PLM\_\_01\_v1\_2.zip

And reference date: 2005-09-08

The MIB was received by email from Sonia Dos-Santos (ASP) on 08/09/2005

### 4.5.2 Configuration & Manual changes

The following files have been manually changed by Alcatel after the generation process (taken from the configuration.txt file included in the MIB):

- CDF.DAT  
HPSDB does not allows fixed counter flags (ie CDF\_ELTYPR=F for counters)  
HPSDB NCR 478
- CDF.DAT  
Problem on the (PTC,PFC)=(7,0) Variable octect string (PP004380).  
PACS has the following data:  
**PC010380 E 8 32 PP004380 R**  
On HPSDB this line is generated  
**PC010380 E 0 32 0 PP004380 R**  
For now has been manually replaced.
- DPC.DAT  
Add the line  
**HA000289 HU035197 63 1 Y N**  
HPSDB NCR, not possible to add User parameters on an alphanumeric display (NCR 495)  
Note: The parameter HU035197 can not be loaded via S2K files, because is not associated to a Packet (NCR created 475)  
Error HPSDB Solution: The parameter as been loaded by the an XML file Add\_Parameter\_HU035197.xml, to correct this problem.
- PLF.DAT  
(HPSDB NCR 474) error when loading/generating SCOS TM packets has fixed and variable but with diferent definitions, (the following packet has the

parameter repeated 16 times on plf.dat, and repeated 0 times (variable) on the vpd.dat table)

The vpd.dat is corrected generated but not the plf.dat

replace the line (manual)

**HM057190 80044289 0 0 1 0 0 0**

by

**HM056190 80044289 16 0 1 0 0 0**

**HM057190 80044289 17 0 64 0 0 0**

- TCD.DAT

Generated empty by HPSDB, NCR 497 replaced by the one used on the tests week 28

- SCO.DAT

replaced by the one used on the tests week 28. This file shall be discussed with S. Ilsen because of the SCOE's names, HPSDB generates the names of the real elements.

- TMD.DAT

Add packets sent by SPIRE team by email on 31/08/2005

- PCF.DAT

Change PCF\_VALPAR=0 on the parameter HU035197 inside of the pcf.dat. This was ok on HIFI, but not done on the XML file loaded

Add\_Parameter\_HU035197.xml

- PLF.DAT

Change the field PLF\_LOGCC from NULL to 32 bits (see email from Luc Dubbeldam- HIFI on 06/09/2005)

**HM057190 80044289 17 0 64 32 0 0**

The following files have been changed manually by ASSED OTN (Stijn Ilsen):

- CAP.DAT – The decimal separator for the EQM CRYO SCOE calibration is manually changed from “,” to “.”. This also to solve problems with the EQM CRYO SCOE calibrations. EQM CRYO SCOE MIB will be updated by ASSED to avoid this problem in the future.
- TMD.DAT – The EQM CRYO packets have been added to the tmd.dat file on the CCS to make sure all EQM CRYO SCOE packets are forwarded to the IEGSE.

Remark: Because of NCR 1482, a MIB change was necessary after the first day of IMT. The CDF.DAT file is changed. Command PC162420 allows 8 entries for parameter PP067420, this is changed into 9.

## 5 Step by Step Procedure: Configure CCS and EGSE

According to Procedure(s):

- HP-2-ASED-PR-0035 (Chapter 3: Order of Execution - steps 1 to 9)

**Remark: Before the start of the IMT, an SFT Cold He 2 was executed. All SCOE's and the CCS were configured at that time and left online after the SFT. This means that all steps in this chapter are actually executed before the SFT and not before the IMT. They are included to have a complete report. More information about the SFT Cold He 2 can be found in the test report (HP-2-ASED-TR-0095)**

**Final Configuration:** SPIRE is in REDY mode

**Remark:** Until now both PACS and HIFI were switched off. They will be first switched on, after which the IMT will continue.

## 8 Step by Step Procedure: Power On Instruments

### Philosophy:

Since SPIRE is already on and in PRIME mode, the SPIRE prime bus profile is loaded on the CDMU DFE. This means that HIFI and SPIRE are considered to be in standby mode from the beginning.

The instruments will be powered on in the following order:

- SPIRE (to PRIME mode) – Already done
- PACS (to PRIME mode)
- HIFI (to STANDBY mode)

### Monitoring:

All data coming from the instruments will be stored on the CCS. No active monitoring will be done on the instruments in standby mode. Of course limits will be monitored and checked and if necessary the instrumenters will be contacted and corrective actions taken.

### 8.1 Power on PACS to STANDBY Mode

#### According to Procedure(s):

- HP-2-ASED-PR-0035 (Chapter 3: Order of Execution – Step 10)
- PACS-ME-TP-021 (Issue 1.1 – 06/09/05 – chapter 4.1)

#### Configuration Check:

Step #	Action	Comments	Check
1	PACS warm electronics is mounted on the SVM		OK
2	28 V power is connected to CCS power supplies		OK
3	PACS OBT interface is connected to CCS OBT simulator		OK
4	DPU 1553 interface is connected to CDMU DFE		OK
5	The CDMU DFE is up and running bus list "nominal"	SPIRE_prime_inst.pst	OK
6	PACS+EGSE grounding has been verified against AD-7		OK
7	Check that all TOPE-Tcl scripts (sec.10) are accessible via the CCS		OK

**Remark: During the power on multiple out of limits were reported. This is a known ASED NCR 1276.**

Step #	Action	Comments	Check
1	Execute script: PACS_POWER_ON_NonPrime.tcl  (log see Appendix 4)	PACS is sending regular non-Prime HK packets and essential HK packets	OK
		1355 links DPU-SPUS, DPU-SPUL, DPU-DMC, DMC-SPUS, DMC-SPUL, DMC-BOLC are on and communicating	OK
		Counters for TM(1,2), TM(1,8) and NACKs shall be 0	OK
		28 V power is on for all 4 sub-systems	OK

## 8.2 Power on HIFI to STANDBY Mode

According to Procedure(s):

- HP-2-ASED-PR-0035 (Chapter 3: Order of Execution – Step 10)
- SRON-G/HIFI/PR/2005-101 chapter 2.4.1 & 2.4.5

**Remark:** Before power on of HIFI, the bus profile is switched to the HIFI prime PST file. This is done to speed up the upload of the OBSW.

**Remark:** The actual switching of the LCL's (PLM SCOE switches) is done with the INSTR\_POWER\_ON.tcl script. The log file of this script can be found in Appendix 5

**Remark:** To speed up the booting of the ICU, it is decided by HIFI that chapter 2.4.5 should be executed instead of 2.4.1 (nominal power on procedure). Chapter 2.4.5 powers on the ICU, uploads new OBSW and boots from this new OBSW.

#### 9.4 SPIRE-IMT-CREC

**Remark:** This is the start of day 2 of SPIRE IMT (27/09/05). It is now clear that the cooler recycle failed during day 1. The cooler only reached ~0.35 K while the expected temperature should be < 0.3K. During the daily briefing, it is decided that the turbopumps will be powered to evacuate the cryostat. This solution successfully worked at RAL to solve cooler recycle problems.

**Remark:** At this point, it is clear that the cooler recycle failed again. An NRB is held to determine the way forward and an NCR is raised to track the problem.

Conclusion from the NRB is to warm up the AXT to 4.2 K, continue pumping and then cool down again. After these activities (in ~36 hours), a new cooler recycle will be done to see if the problem is resolved. The SPIRE instrument is left in STANDBY until then.

Description of Nonconformance										Requirements Violated	
<p>The first SPIRE cooler recycling performed on 26.09.05 only achieved a temp of app 0.420 K and a hold time of less than 3 hrs.</p> <p>A second recycle was tried on 27.09.05 after the cryostat had been pumped/evacuated for 3 hrs. The air lock had been closed for app 10 days when the PLM was moved to the tilting dolly prior to the start of IMT, Pump was still running following the reintegration.</p> <p>The leak detection was 10-4mblt/sec.</p> <p>The second recycle achieved a temp of 0.328k but this is not sufficient for performance tests. (Temp plots to be attached).</p> <p>Customer NRB to be held 27.09.05 (telecon ESA)</p>										SPIRE IMT TP

<b>Internal NRB Dispositions</b> 27.09.05 ESA,ASP,ASED,RAL. SPIRE consider that IMT cannot continue until cooler recycling can be successfully performed and a temp below 0.300k can be achieved. The possible causes of the failure were identified as follows. 1)He 4 leak causing a He film on the detector surface.This was seen during ILT and the temp was increased to 4.2k to remove the film and was successful in achieving a good recycling and hold time. 2)He 3 problem with strap or heat switch. The NRB agrees 2 parallel actions. A1/1 SPIRE to analyse the load curves to investigate problems of strap and heat switch A1/2 ASED to heat up AXT to 4.2k and continue pumping for 24 to 36 hrs (till 29.09.05 morning)to remove the He film from the detector and evaporator surfaces and remove the He. Vacuum and leak detection will be monitored. Temp,vacuum and leak detection values will be assessen prior to a further cooler recycle on 29.09.05 AM, the results of this test will be discussed in a follow on NRB to be reconvered after the test.
