## 1. INTRODUCTION

This technical note has the objective to identify the generic items that shall be input on HPSDB central site by the prime company before HPSDB being available to the Users.

Generic items are the items which are not attached to an element, subsystem or model but which can be referenced by any element, subsystem or model. Those items are not instantiated, they are defined in the generic box. HPSDB supports the definition of all items as generic.

All the HPSDB Users have read access to this type of data, but only the HPSDB central site manager has write access.

It is expected that all HPSDB users make use of those generic items in order to avoid unsafe duplication of items ( for instance several ON / OFF curves with small differences in the way that they are implemented). In particular, reference must be made to :

- TM PSICD items

One TM PSICD item is present plus 1 for Time Packet in generic box for each TM service type, and subtype defined on RD1 ( see 3.1.2 TM packet PSICD data). There is no need to create any other TM Packet PSICD or TM Packet Standard.

Note that for TM (8,6), TM(8,7) and TM (8,9) the Function ID and the Activity ID defined on RD1 as two 8- bit parameters have been merged in an unique 16 bit parameter.

Note : the generic PSICD items contains the structure identifier 1 (SID1) and the structure identifier 2 (SID2) position and length which shall be used by all the Herschel / Planck users (refer to AD1 issue 2.2).

- Acquisition parameter items

16 Spare acquisition parameters are defined for all users except Flight Dynamic Data

16 Spare acquisition parameters are defined only for Software Users.

- User Defined constant Dynamic- One UDC is created to define the environment description.

- TC Packet Header items

Three TC packet Header are defined ( see 3.2.1 TC packet header data)

- GX000000 TC Packet Header With Data Field Header Low Priority
- GX001000 TC packet header without header (ie no entries on the pcpc.dat and tcpf.dat scos tables)
- GX002000 has to be refer to by the standard TC (2,3)
- GX004000 TC Packet Header With Data Field Header High Priority

Consequently there is no need to create any other TC packet header nor Command Header parameters items.

An exception to this rule can be envisaged for the testing of TC packet with TC Header rejection. Because a wrong TC packet will not be created on a generic box.

- Command Header Parameters

16 command header parameters are defined for all users except Flight Dynamic Data

- TC Packet

Load Command on the MTL

TC -With the secondary header plus all the header parameters defined as editable command parameters

TC-Without the secondary header plus all the header parameters defined as editable command parameters

TC Frame- Unlock Directive

- TC Frame- set V(R)

- 17 Command Verification stages
- Command parameter items
  - 16 Spare command parameters are defined with value 0
  - 6 command parameters.
  - 15 command parameters (editable parameters associated to the two TC with the secondary header plus all the header parameters defined as editable command parameters, TC-Without the secondary header plus all the header parameters defined as editable command parameters)
- Calibration Curves
  - 48 digital calibration curves are defined (see 3.8.1 Digital curve data )
  - 2 Discrete curve
  - 1 polynomial calibration curves are defined (see 3.8.4 Polynomial Curves )
- 1 Parameter Range set
- 1 Packet standard Template

For the following generic items :

- Calibration curve,
- Command verification stage,
- Parameter range set

In addition due to S2K Command Verification Stage identifier format (integer in the range [0..65535], the HPSDB generic CVS identifier shall be in the range [000-9999], this is not controlled by HPSDB it is the user responsibility to check it.

## 3.7.2 Acquisition Parameters ( for OBSW User)

16 Spare parameters have been created for OBSW users, because of their need of having more than once the same spare parameter (not supper commutated ) inside of the same SCOS TM packet . As SCOS 2000 does not allows this, those 16 spare parameters are not generated by HPSDB on the SCOS /CCS bridge files (but the user can see them on the XML print, and on the HPSDB MMI)

## 4. UPDATING GENERIC BOX CONTENTS PROCESS

The contents of a generic box has been defined taking into account the present knowledge of spacecraft development.

It is foreseen to keep the contents of generic box in line with the HPSDB users needs. For this purpose, HPSDB users are invited to submit to HPSDB manager approval updates of generic box contents with general purpose scope.

## 6. ANNEX 2- CURVE G000102000- PT2K 118BJA ADC TO K

Discrete calibration curve G000102000- PT2K 118BJA ADC to K calculation:

HEXADECIMAL (*f o g o h*) where:

h= discrete curve Kelvin to Ohm:

- See [RD5]
- See 2 first columns on the table below

$$g = \frac{5 * R_{th}}{R_{th} + R_p} \text{ (Ohm to Voltage) :}$$

- See [RD4](Chapter 13.3 Acquisition- CDMU Input Signals- Planck, where  $R_p = 10000\text{Ohm}$  for CR Channel).
- See third column table below

$$h = \frac{35 + V(4096 * 1.681)}{10} \text{ (Voltage to ADC)}$$

- See [RD4]( Chapter 13.3 Acquisition- CDMU Input Signals- Planck)
- See fourth column table below

HEXADECIMAL (*f o g o h*) (ADC Dec to ADC Hexadecimal)

- See fifth column table below

ADC Dec to ADC Hexadecimal Left shift of 4 bits

ADC[Hex] \*10

- See sixth column table below
