

GCMS Data Processing Commentary

This document describes, with examples, the process of extracting the GCMS data from its raw (telemetry) format to a more useful processed format: e.g., converting the raw numbers to the more useful counts per second form.

The level (Stage) of data processing represents:

Stage	Description
0	Raw telemetry data contained in a binary formatted fixed record length file. The fixed record length used by the binary file is not the same as any of the record lengths of the GCMS data types serially packed and transmitted in this file.
1	The raw data converted to ASCII text format.
1-2	The Stage 1 data converted to counts per integration period (c/ip) format.
2	The Stage 1-2 data converted to counts per second (c/s) format. This data is corrected for the known data system counter overflow condition where this condition is obvious.
3	The Stage 2 data fully corrected for known instrumental and data system effects: 1) the counter system data overflow condition, 2) applying well defined empirical methods to correct the data for pulse pile-up and non-paralyzed counter system dead time corrections and 3) corrections resulting from the calibration of the spare instrument using selected species of interest.

Stage	Description
0	Raw telemetry data contained in a binary formatted fixed record length file. The fixed record length used by the binary file is not the same as any of the record lengths of the GCMS data types serially packed and transmitted in this file.
1	The raw data converted to ASCII text format.
1-2	The Stage 1 data converted to counts per integration period (c/ip) format.
2	The Stage 1-2 data converted to counts per second (c/s) format. This data is corrected for the known data system counter overflow condition where this condition is obvious.
3	The Stage 2 data fully corrected for known instrumental and data system effects: 1) the counter system data overflow condition, 2) applying well defined empirical methods to correct the data for pulse pile-up and non-paralyzed counter system dead time corrections and 3) corrections resulting from the calibration of the spare instrument using selected species of interest.

At the time of the initial data submissions to the PSA (ESA's Planetary Science Archives) and the PDS (NASA's Planetary Data System) only the Stage 1 and 2 data processing has been completed. The Stage 0 and intermediate Stage 1-2 data files will not be archived. The Stage 3 data files will be submitted at a later date.

This document does not detail the conversion from the telemetry file to the Stage 1 processed files. The archived Stage 1 files contain all of the data from the telemetry file and organize the data by the source of the data: e.g., mass sweep data, housekeeping (instrument health) types 1 or 2 files, etc. The details of converting the raw serially packed variable record lengths binary formatted telemetry file involve pushing the file values through the probe interface simulator hardware. This information is contained in documentation written and submitted during the Huygens Probe mission development, design and testing period.

All Stage 1 processed data table files can be identified by the text “_STG1.TAB” in the file name. All GCMS data tables contain as their first line the column labels needed to identify the data in that column. The label file sharing the base file name with the table file contains additional information relative to the content of the data table. The GCMS mass scan data in these Stage 1 processed data files consists of only numerical values ranging from 0 – 255.

GCMS Data Processing Commentary

Rules governing the GCMS data value coded and telemetered to Earth.

GCMS Counter Data (counts per integration period) (integration period is 4.592 ms)	Value Telemetered
0 - 127	The data value
Greater than 127	<p>The low 7 bits of the square root of the data value. (A number between 0 and 127.) Bit 8 is set to “1” to flag this data as square root compressed.</p> <p>The GCMS counter system (electron multiplier and counter electronics) have an exceptionally large dynamic range. Thus valid count rates greater than 16129 (127^2) c/ip (3,512,412 c/s) sometimes are observed. Then we have a counter overflow condition that is not flagged by the data system. The data processor/user must manually examine the data to determine if this overflow is present. However, the behavior of counting systems at very high count rates is non-linear and, generally, only poorly understood.</p>

Rules for Processing the Stage 1 (raw) data to Stage 2 (counts per second) data.

These data conversion rules apply to the data in all of the data tables included with this document. Text and background color have been added to the tables to emphasize where the conversion and correction rules may apply. Masses are referred to as ‘A’, ‘B’ or ‘C’.

Column	Label	Description	If RMn < 128	If RMn >= 128
1	ABS_T	Absolute Time (Clock Tics)	<p>Black text identifies data requiring no additional processing. Blue text identifies square root compressed data. Red text or background identifies counter overflow data.</p>	
2	Rel_T	Relative Time (seconds)		
<i>Stage 1 Processed (raw) Data</i>				
4	RMA	Raw Mass A Data	Stage 1 Data for mass “n”	
5	RMB	Raw Mass B Data		
6	RMC	Raw Mass C Data		

GCMS Data Processing Commentary

Column	Label	Description	If RMn < 128	If RMn >= 128
<i>Stage 1-2 (intermediate) Processing</i>				
8	IPMA	Mass A Counts (c/ip)	Counts per integration period IPMn = RMn	Counts per integration period IPMn = (RMn -128)^2
9	IPMB	Mass B Counts (c/ip)		
10	IPMC	Mass C Counts (c/ip)		
<i>Stage 2 Processed Data – No Data Corrections Required</i>				
12	MA	Mass A Counts (c/s)		Counts per second Mn = IPMn/0.004592
13	MB	Mass B Counts (c/s)		
14	MC	Mass C Counts (c/s)		
<i>Manually Corrected Stage 1-2 processed Data</i>				
16	CIPMA	Corrected Mass A Counts (c/ip)	<u>Counter Overflow</u> never yields RMn < 128!	User intervention required! Corrected Counts per integration period. CIPMn = (RMn)^2
17	CIPMB	Corrected Mass B Counts (c/ip)		
18	CIPMC	Corrected Mass C Counts (c/ip)		
<i>Manually Corrected Stage 2 processed Data</i>				
20	CMA	Corrected Mass A Counts (c/s)	Counts per second CMn = IPMn/0.004592	Corrected Counts per second CMn = CIPMn/0.004592
21	CMB	Corrected Mass B Counts (c/s)		
22	CMC	Corrected Mass C Counts (c/s)		

GCMS Data Processing Commentary

Case 1: Residual Gas Pump-down after GCMS Instrument Power On.

The data table in this example presents data from a GCMS in-flight checkout test demonstrating the easily identifiable presence of counter overflow occurring after instrument turn on with the ion-pumps remaining off. This is done to observe the residual gases background before the instrument's ion pumps are activated and the resulting pump down. The counter overflow is obvious because the process of residual gas background pump-down is well understood and exhibits a 'smooth' (exponential) behavior.

Black text represents data that requires no adjustment (i.e., values less than 128.)

Blue text indicates data that has been square rooted prior to the transfer of the low 7 bits of the value to the data system.

Red text or a 'pink' background indicates data that is user identified as exhibiting the counter data buffer overflow condition.

The data in this table is also presented in graphic form for the three masses identified as 'A', 'B' and 'C'. The counter data overflow problem is 'obvious' from the plots. The **uncorrected data is plotted using the blue line with dots**. The values identified during data processing as exhibiting the overflow condition, the **corrected data, are plotted using the red line**.

GCMS Data Processing Example

Mass 'A': No counter overflow corrections necessary

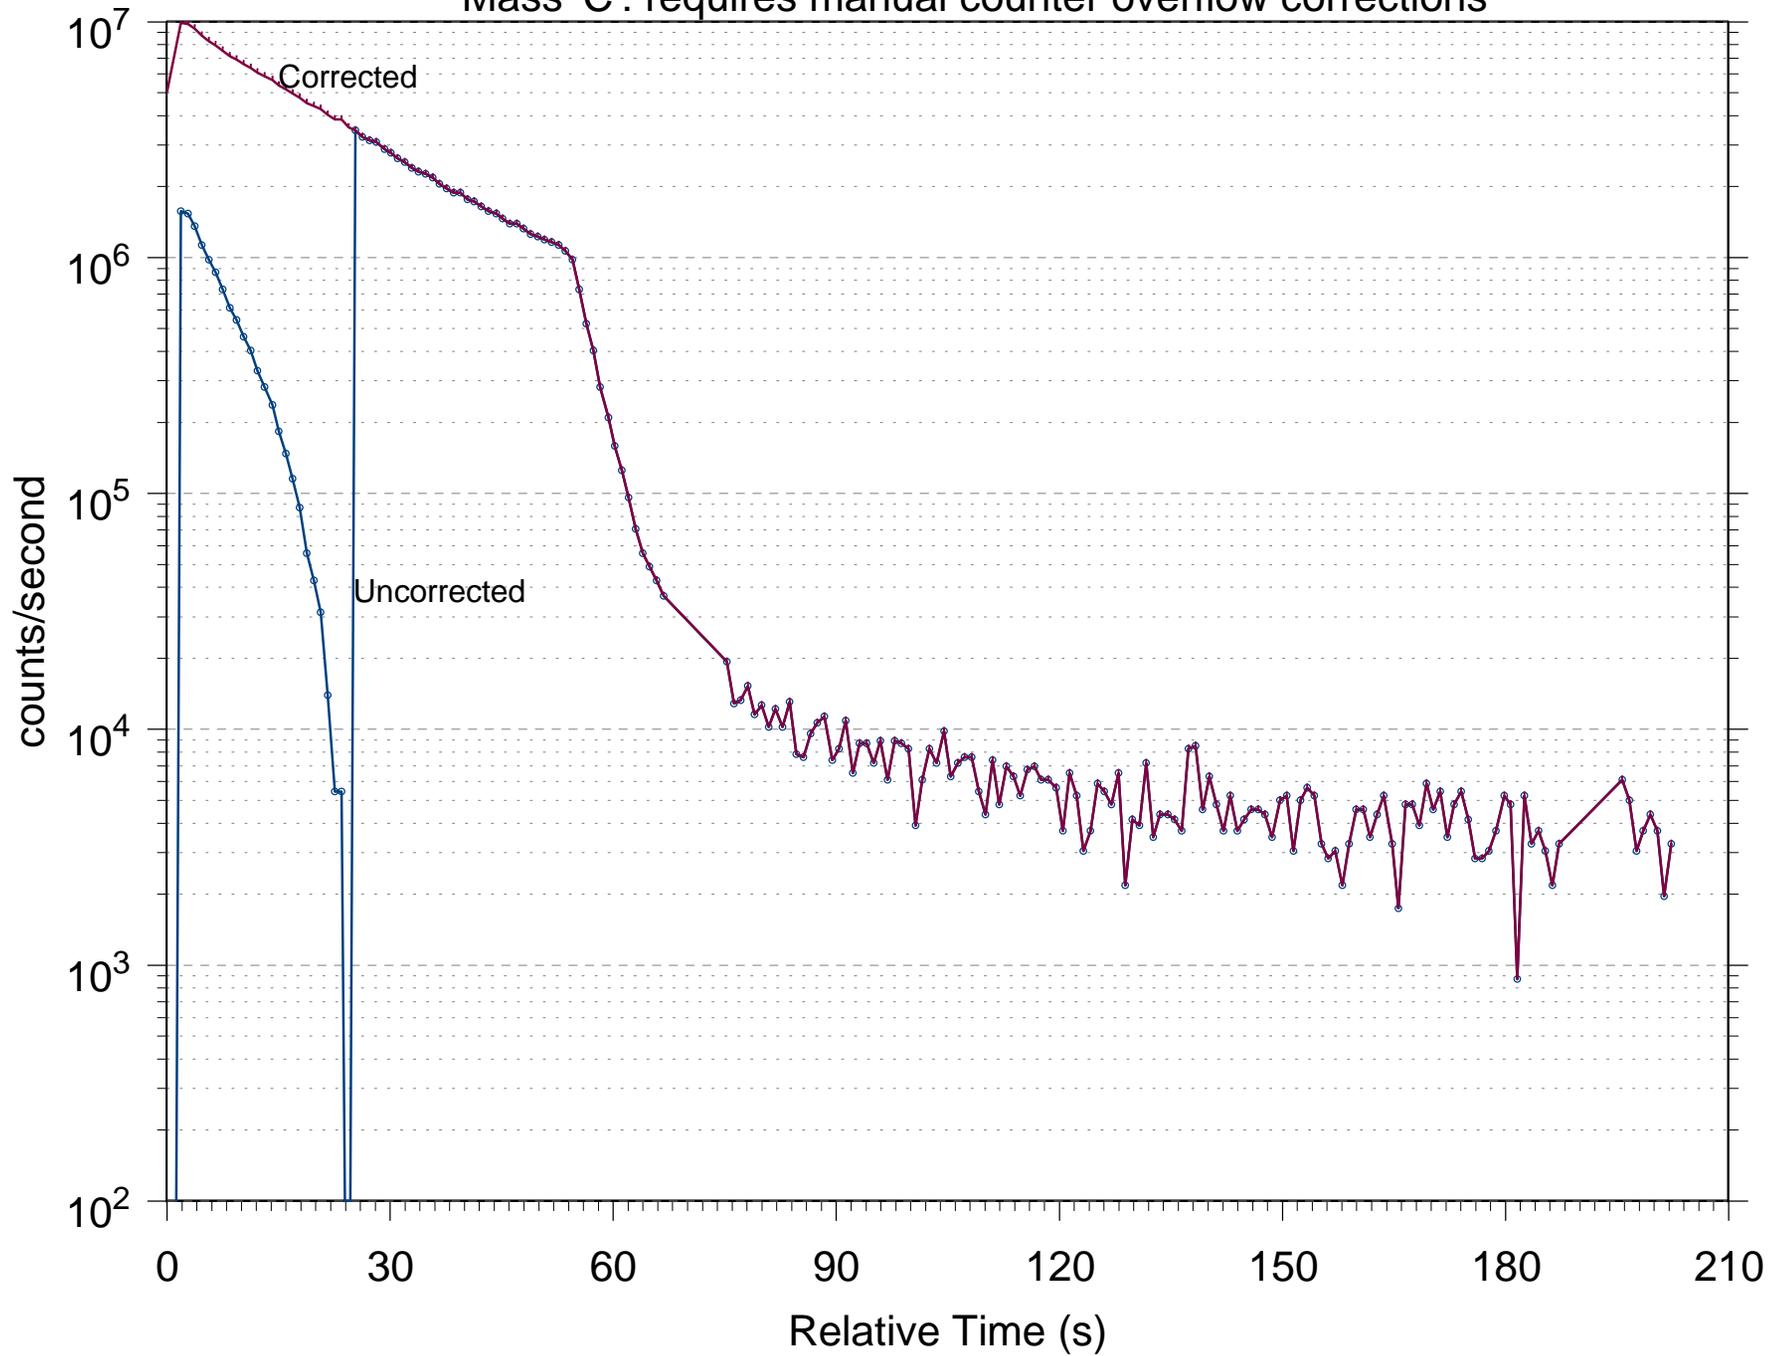

GCMS Data Processing Example

Mass 'B': requires manual counter overflow corrections

GCMS Data Processing Example

Mass 'C': requires manual counter overflow corrections

GCMS Data Processing Commentary

Case 2: Monitoring GCMS Data during Titan Entry – Smooth species profiles might not be observed.

The following table presents data from the Titan Descent exhibiting the counter overflow condition and demonstrating the difficulties in identifying this condition. The processing guide, above, describing data handling applies to this data example. As before the masses are referenced as ‘A’, ‘B’ and ‘C’.

Black text represents data requiring no adjustment (i.e., values less than 128) and there are no such data in this example.

Blue text indicates data that has been square rooted prior to the transfer of the low 7 bits of the value to the data system.

Red text or a **‘pink’ background** indicates data that is user identified as suffering from the counter data buffer overflow condition.

The identification of the counter overflow data condition is especially difficult with this data. Presenting the data from the table in graphic form assists the user in determining the presence of the counter overflow problem. In the plots below the **blue line with dots presents the data as uncorrected** and the **red line displays the corrected data** identified by the user. The difficulty is that no data bit explicitly identifies the counter overflow condition. The data ‘compression’ method dictates that the data range of 128 – 139 must indicate counter overflow. Otherwise data values 140 – 255 must be interpreted by the data processor/user as either ‘normal’ or ‘overflow’ values.

The Mass ‘A’ plot below presents the data assuming that no overflow has occurred. But, is the ‘dip’ at 173 s an indication of overflow? Is the dip a transitory effect resulting from some instrument or spacecraft component operation? Did the ‘dip’ result because the probe is swinging under the parachute causing the gas flow through the GCMS to affect the data?

The Mass ‘B’ and ‘C’ plots below present the data as **uncorrected (blue)** and **corrected (red)**. Upon examination, it appears that the points at 181, 188 and 203 s indicate overflow and need to be corrected. We expect the signals to vary smoothly as we descend into the atmosphere. Should the point at 196 s be corrected and then the plot will show one peak? If we had passed through a cloud then we expect 1 peak. Should we not correct the point as 196 s and show two peaks? What if aerosol particles had entered the heated inlet system and the adsorbed gases volatilized? What if liquid droplets had entered the heated inlet system and vaporized? Other?

Additional work in the laboratory with the spare flight instrument is required before we will better understand the operation and behavior of the GCMS instrument and its data system and how to fully ‘process’ and ‘correct’ the data.

GCMS Data Processing Example

Mass 'A': No counter overflow corrections necessary?

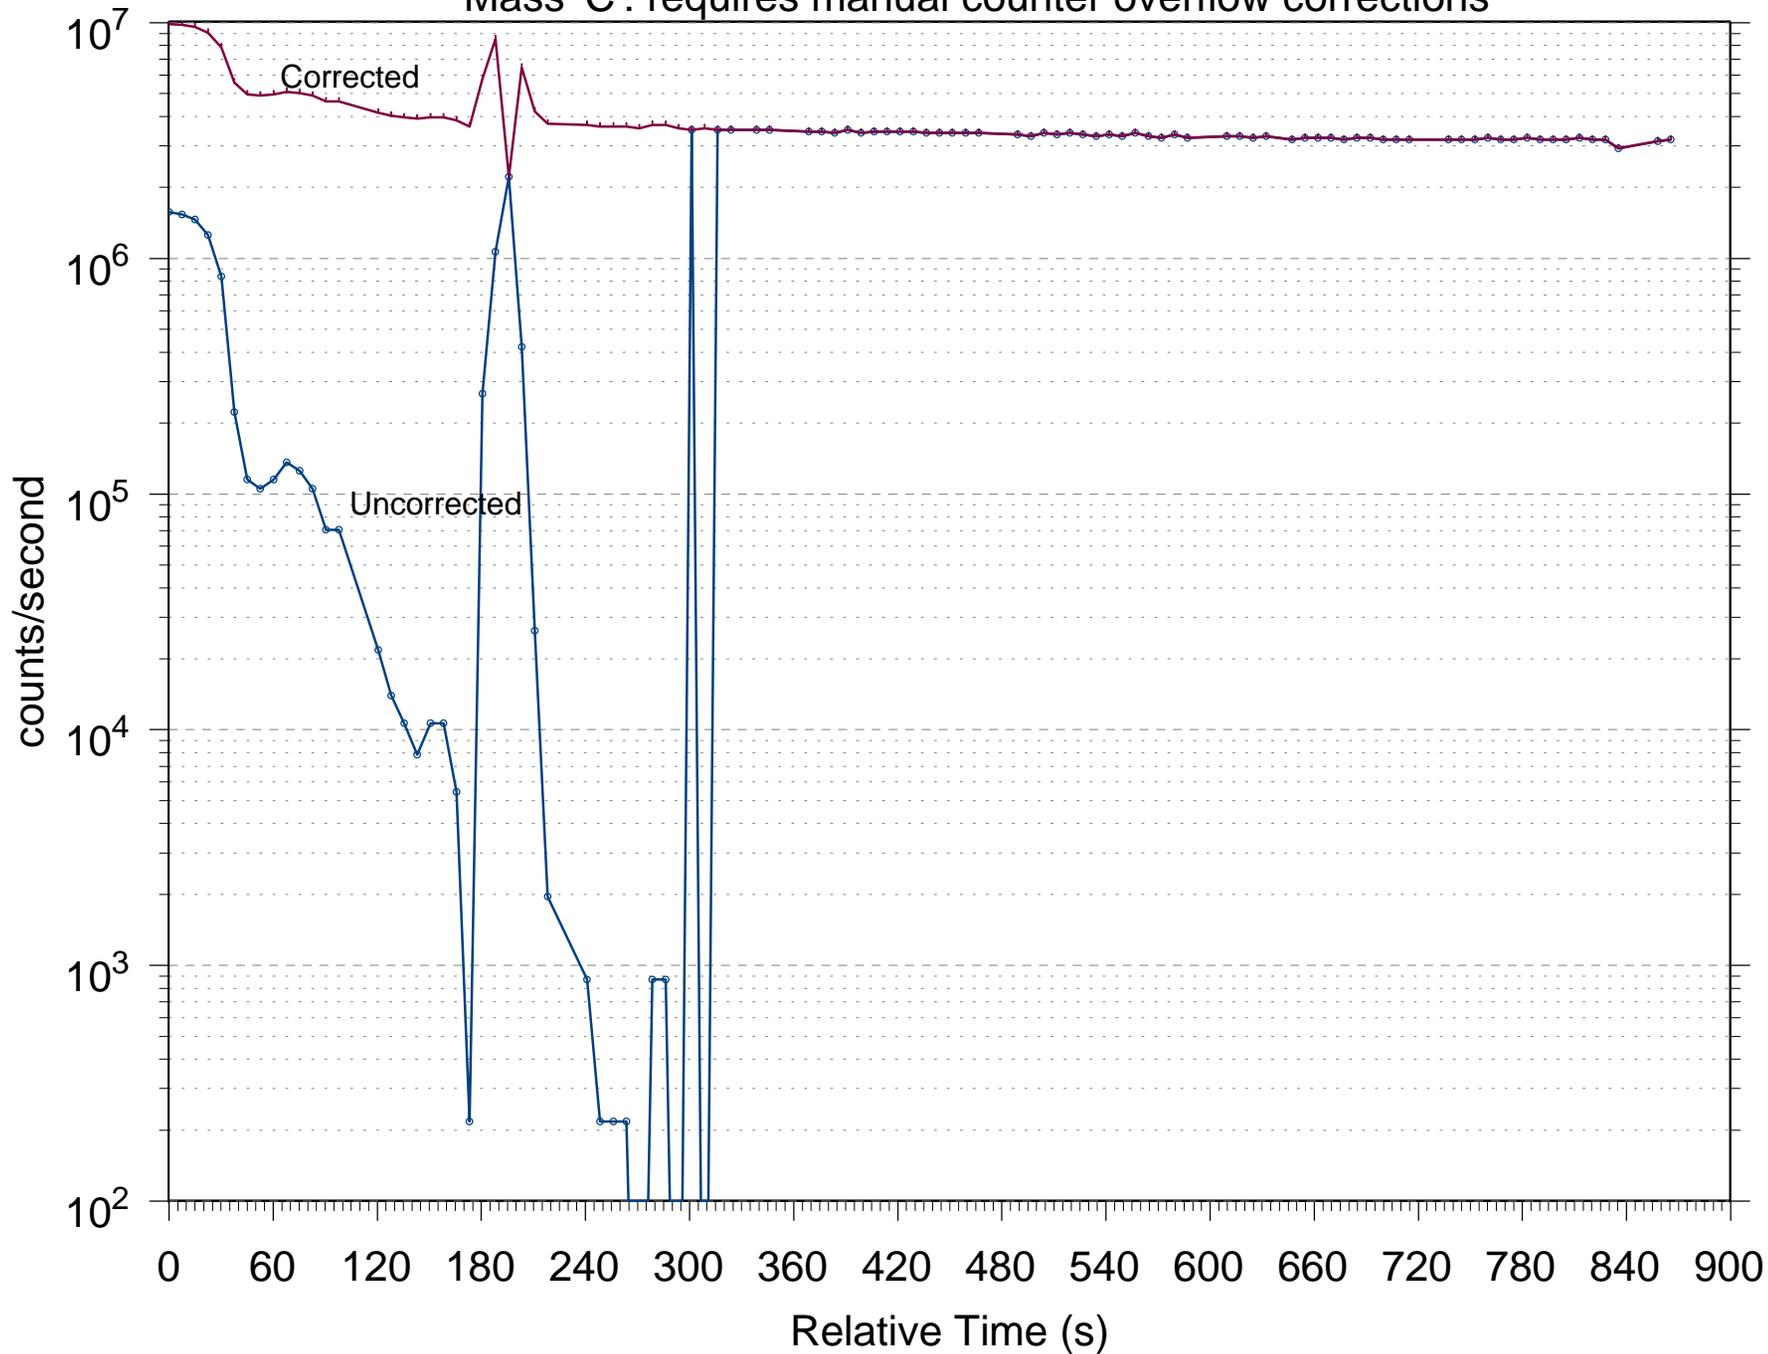

GCMS Data Processing Example

Mass 'B': requires manual counter overflow corrections

GCMS Data Processing Example

Mass 'C': requires manual counter overflow corrections

GCMS Data Processing Commentary

Work in progress: When will we deliver Stage 3 processed data?

The counting system 'dead time' correction (standard form shown below) is an ongoing analytical exercise. The following tentative 'correction factor' provides a reasonable fit with this data. However, other counting system factors also impact the data 'corrections' and this work requires many further refinements.

$$n = n_0 / (1 - n_0 \tau)$$

n = real count rate

n₀ = observed count rate

τ = 'correction factor' ~ 2.09 x 10⁻⁸ for the instrument flown to Titan

Additional work is required to resolve the uncertainties related to the behavior of the counting system. The behavior of counting systems at very high count rates is non-linear, is a function of the complete system (multiplier, pre-amplifier, amplifier and all associated electronics) and is not fully understood. Laboratory work with the spare instrument is required before we believe that we understand the GCMS counter overflow problem. The issue of species detection and this instrument's detection efficiencies are not yet fully understood. Laboratory "calibration" work with the "spare" unit, identical to the one used at Titan, will be performed in the laboratories at Goddard. As these efforts are completed, currently planned for late 2006 or early 2007, these calibration data will be used to develop the corrected and definitive 'Stage 3' dataset for submission to the data archives. The calibration data will also be archived.
