## Distribution List

### Change Log

Date	Sections Changed	Reasons for Change
1 March 2004	All sections	Draft 2
23.January.2006	All sections	First official release
9 October. 2006	1.5, 2, 3,4.3	Dataset delivery scheme updated, geometry information added. All the labels updated
12 December 2008		Spectrum data contains mass scale
3 February 2011	2.3, 2.4.1, 3.2.3, 4.3	New formats for images, new products for scans and heating
19 March 2015		Update in the labels, delivery schedule
09 September 2015	4.3.6	Update HEAT.TAB
28 December 2015		Update FITS header with used subimage mask. Add SUBSTRATE-Z offset to spectrum product.
21 April 2016		Explain peak list in more details. Update image and grain format and add test image description.

# 1 Introduction

## 1.1 Purpose and Scope

The purpose of this EAICD (Experimenter to (Science) Archive Interface Control Document) is two fold. First it provides users of the the COSIMA instrument with a detailed description of the product and a description of how it was generated, including data sources and destinations. Secondly, it is the official interface between the COSIMA instrument team and Rosetta archiving authority.

## 1.2 Archiving Authorities

ESA's Planetary Science Archive (PSA).

## 1.3 Contents

This document describes the data flow of the COSIMA instrument on ROSETTA from the spacecraft until the insertion into the PSA for ESA. It includes information on how data were processed, formatted, labeled and uniquely identified. The document discusses general naming schemes for data volumes, data sets, data and label files. Standards used to generate the product are explained. Software that may be used to access the product is explained further on.

The design of the data set structure and the data product is given. Examples of these are given in the appendix.

## 1.4 Intended Readership

The staff of the archiving authority (Planetary Science Archive, ESA, RSSD, design team) and any potential user of the COSIMA data.

## 2 Overview of Instrument Design, Data Handling Process and Product Generation

### 2.1 Scientific Objectives

The *in situ* chemical analysis of solids in space is among the tasks which are technically most difficult. There are two main reasons for that: With a few exceptions solids in space are not abundant, and secondly it is not easy to remove small samples from the solid into the vacuum for the analysis in a mass spectrometer.

For COSIMA the objects of interest are cometary dust particles, which are abundant, indeed, in the neighbourhood of the comet nucleus. It remains, however, to collect and bring the particles to the entrance of the spectrometer.

Most mass spectrometers need parts of the sample to be analyzed, to carry an electronic charge. The process of removing an ion from the specimen is then the critical feature of the method to be chosen.

The only mass spectrometric data on cometary dust particles available to date, come from the dust impact mass spectrometers PIA and PUMA on the GIOTTO and VEGA spacecrafts, respectively. While other, remote, or indirect methods allow measurements of collective properties of the cometary dust, the mass spectrometers allowed the analysis of individual particles (cf Kissel et al. 1986a+b). Since then we know unambiguously that each particle is an intimate mixture of a mineral core and ices, and simple as well as complex organic molecules. Since the impact velocity was large ( $>60$  km/s) mostly atomic ions were formed and analyzed in the Halley case. In a first attempt, however, Kissel and Krueger (1987) found evidence for the chemical nature of the organic cometary material. It is clear that not a few well known molecules constitute the cometary organics, but rather some chemical classes, with each being represented by a large number of individual substances. Indeed, it seems, that all stable molecules compatible with the chemical environment are formed and even cross-linked between them.

COSIMA therefore needed to be based on a method which is readily available in laboratory, and which allows for tracing the ion directly to the molecular and structural form in which it was present in the solid. Since the size distribution of the dust particles is known (cf, Mazets et al. 1987, McDonnell et al. 1989) a reasonable ionizing beam focus should be achieved under the limitations of space instrumentation. Even though the method would be destructive, its sensitivity should be high enough to allow several analyses at different depths for one individual, say  $20\text{ }\mu\text{m}$  particle.

To satisfy all these requirements we choose the method of **Secondary Ion Mass Spectroscopy** (SIMS). A fast primary ion, in this case  $^{115}\text{In}^+$  at 10 keV, impacts the sample and releases by desorption molecules of the material under test, of which typically 0.1 to 10 % are ionized, the so-called secondary ions. For sensitivity reasons, the analysis of a rather large mass range should be achieved simultaneously, which in turn leads to the type of a time-of-flight mass spectrometer. The mass resolution must be high enough to resolve isobaric ions, at least between atomic and molecular ions. The total ion mass should at least cover 3500 Da. In total, the COSIMA instrument has the following main functional hardware elements:

- the dust collector and target manipulator (TMU),
- COSISCOPE, a microscope CCD camera for target inspection,
- the primary ion source,
- the mass spectrometer including the ion extraction optics and the ion detector
- Electronics and computer.

It should be mentioned at this point, that COSIMA did profit from but is not identical to the earlier development of the CoMA instrument for the NASA mission CRAF (Zscheeg, 1992) which was canceled in 1992.

The entire development of COSIMA was challenged by the complexity of the cometary material which has to be expected. This has focused the goal of COSIMA on the identification of chemical classes and functional groups rather than the identification of individual substances. Consequently the system must have the capability to use the methods of chemometry to compress the raw data on board, which helps to reduce the data volume without losing any of the chemical information.

There is also another important aspect for COSIMA, which comes from the rather long time the spacecraft travels from launch in 2004 until the core of the measurements takes place in 2014: Quite a large number of relevant results will be obtained from laboratory measurements with TOF SIMS, be it by the COSIMA team or be it in the published literature. In addition, NASA in its DISCOVERY program has several comet missions, which are expected to produce new, relevant data, before COSIMA enters its main analysis phase. Even if most of the flexibility is with the software involved, it is the hardware, which has to provide the resources necessary. Looking back at the fast development in the computer sector over the last ten years this alone is a demanding task, even without the complexity of an up to date analysis instrument.

The scientific return from COSIMA consists primarily of time-of-flight spectra supported by housekeeping data. In addition to this, a limited number of peaks presented as a peak list, may be available. The time-of-flight spectra are archived according to standard PDS rules. These spectra are calibrated to a preliminary mass scale by automatic software.

In addition to time-of-flight spectra, pictures of dust targets (substrates) taken by COSISCOPE camera, and lists of dust grains found on the targets, are also archived.

Operational history of each target substrate is given. The history contains information about substrate storage and expose periods, cleaning and heating actions, COSISCOPE camera images and grains lists and any spectra taken. The history product contains history from the moment substrates were installed in the COSIMA flight instrument.

## 2.2 Instrument sub-systems

COSIMA sub-systems are described in more detail in COSIMA paper [RD2]. Only a brief description is given here, as the paper can be found in ASCII and in PDF form from the DOCUMENT directory.

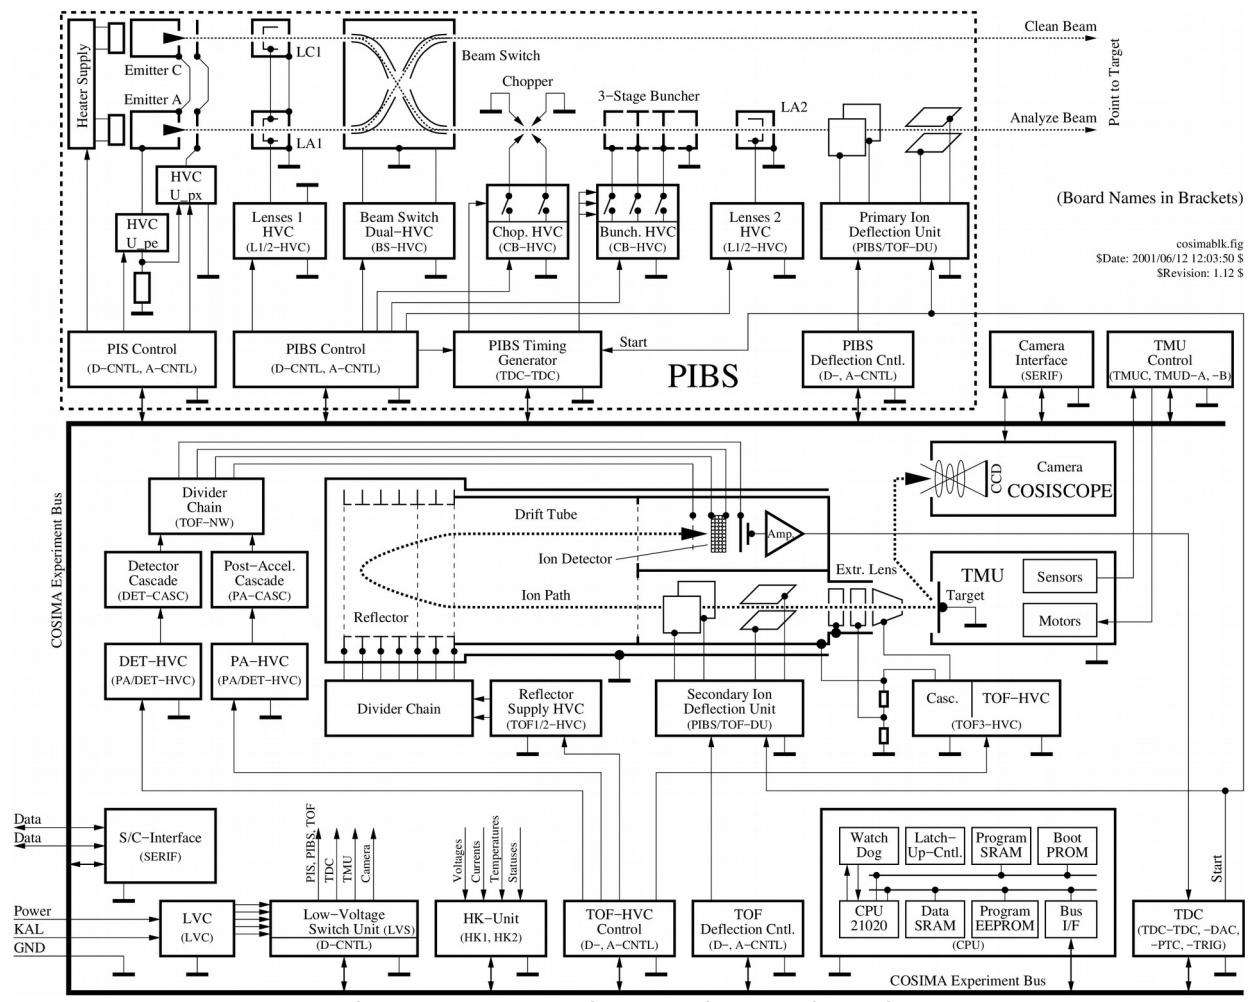

Figure 1: COSIMA subsystems schematics

## 2.2.1 TMU

The Target Manipulator Unit keeps track of, stores and moves dust collection substrates in the instrument. There are total of 24 target holders, each containing 3 substrates. The substrate itself is a 10\*10 millimeter plate, each having different chemical properties. The TMU can also be used to scan a substrate in front of an ion beam. The operation of the TMU is constrained by heat dissipation and is in general slow (tens of minutes per operation).

The substrates can have the following position identifications::

STORAGE, in target storage

IMAGE, substrate image

GRAINS, dust position list

PEAKS, peak list acquisition

SCAN, total count acquition

SPECTRUM, spectrum acquistion

EXPOSE, exposed to the outside, still in TMU grasp

COLLECT, exposed to the outside

CLEAN, at beam cleaning position

HEAT, at chemistry (heating) station

In the substrate history, if the substrate is not in the STORAGE, EXPOSE, COLLECT or HEAT position, it is grasped by the TMU and usually moved to the analysis position for SPECTRUM, SCAN or PEAKS or in front of the COSISCOPE for IMAGE or GRAINS.

The 24 target holders are numbered with hexadecimal numbers from #C1 to #D8. The top substrate is marked with the number #100, the middle with #200 and the low with #300. The combination of these numbers give the substrate identification number used in the instrument commanding and data handling.

The subsrates have the following properties:

#1C1	Palladium, black
#2C1	Platinum, deep black
#3C1	Platinum, deep black
#1C2	Silver, 73 micrometer thickness, blank with rectangular hole 3.5x3.5mm
#2C2	Silver, 69 micrometer thickness,blank with AgTe spot of about 3 mm size at center
#3C2	Gold, 17 micrometer thickness, olivine particles
#1C3	Gold, 8 micrometer thickness
#2C3	Gold, 15 micrometer thickness
#3C3	Gold, 20-30 micrometer thickness
#1C4	Palladium, black
#2C4	Silver, 14 micrometer thickness
#3C4	Gold, 12 micrometer thickness
#1C5	Platinum, light black,
#2C5	Platinum, deep black
#3C5	Gold, 13 micrometer thickness
#1C6	Platinum, deep black
#2C6	Platinum, deep black
#3C6	Gold, 8 micrometer thickness
#1C7	Silver, blank

#2C7	Silver, 21 micrometer thickness
#3C7	Gold, 15 micrometer thickness
#1C8	Platinum, deep black
#2C8	Platinum, deep black
#3C8	Gold, 20-30 micrometer thickness
#1C9	Gold, 5-8 micrometer thickness
#2C9	Gold, 5-8 micrometer thickness
#3C9	Gold, 11 micrometer thickness
#1CA	Gold, 5-8 micrometer thickness
#2CA	Gold, 16 micrometer thickness
#3CA	Silver, 10 micrometer thickness
#1CB	Gold, 17 micrometer thickness
#2CB	Gold, 14 micrometer thickness
#3CB	Gold, 20-30 micrometer thickness
#1CC	Silver, 21 micrometer thickness
#2CC	Silver, 21 micrometer thickness
#3CC	Silver, 24 micrometer thickness
#1CD	Gold, 5-8 micrometer thickness
#2CD	Gold, 14 micrometer thickness
#3CD	Gold, 20-30 micrometer thickness
#1CE	Gold, 5-8 micrometer thickness, Ag particles
#2CE	Gold, 11 micrometer thickness
#3CE	Gold, 20-30 micrometer thickness
#1CF	Gold, 8 micrometer thickness
#2CF	Gold, 12 micrometer thickness, Ag particles
#3CF	Gold, 20-30 micrometer thickness
#1D0	Gold, 20-30 micrometer thickness
#2D0	Gold, 20-30 micrometer thickness
#3D0	Gold, 20-30 micrometer thickness, Ag particles
#1D1	Silver, blank
#2D1	Gold, 13 micrometer thickness
#3D1	Gold, 13 micrometer thickness
#1D2	Gold, 8 micrometer thickness
#2D2	Gold, 8 micrometer thickness
#3D2	Silver, 30 micrometer thickness
#1D3	Silver, 10 micrometer thickness
#2D3	Silver, 10 micrometer thickness
#3D3	Silver, 32 micrometer thickness
#1D4	Platinum, sintered
#2D4	Platinum, deep black
#3D4	Platinum, deep black

#1D5	Platinum, deep black
#2D5	Silver, 22 micrometer thickness
#3D5	Silver, 21 micrometer thickness
#1D6	Platinum, deep black
#2D6	Palladium, black
#3D6	Platinum, deep black
#1D7	Silver, blank
#2D7	Platinum, sintered
#3D7	Platinum, sintered
#1D8	Silver, blank, square hole 3.5x3.5mm at center
#2D8	Silver, blank
#3D8	Gold, 8 micrometer thickness

Positions in the substrate are given in substrate coordinates, which have the origin at lower left corner and range from 0 to 10000 micrometers in both horizontal (X) and vertical (Y) direction.

## 2.2.2 COSISCOPE

COSISCOPE is a CCD camera that is used to take pictures of TMU target substrates and find dust grains on them. COSISCOPE returns CCD images and grain lists with dust grain coordinates, sizes and brightness properties. The gray image has a 10 bit depth with resolution of 1024\*1024 pixels and covers an area of 14\*14 millimeters.

The COSISCOPE pixel coordinates are converted to substrate coordinates, which have the origin at lower left corner and range from 0 to 10000 micrometers in both horizontal (X) and vertical (Y) direction.

## 2.2.3 Primary Ion Source (PIS)

The Primary Ion Source provides isotopically clean  $^{115}\text{In}^+$ . The ion source has a limited lifetime of nominally 2000 hours. After a long period of inactivity it may be difficult to start. The instrument contains two ion sources, both of which can be used. The startup of the PIS is slow (~ 0.5-1 hour). PIS has two ion sources, A (stands for 'Analyse') and C (stands for 'Clean'). A is primarily used for analysis operations, and C for cleaning operations.

## 2.2.4 Primary Ion Beam System (PIBS)

The Primary Ion Beam System focuses, bunches and deflects ions into periodic pulse trains to hit the dust grains to be analyzed. The beam thickness is less than 100  $\mu\text{m}$  and the pulse width a few ns. The PIBS can also be used to clean the target by a continuous beam. The instrument contains one analysis beam and one cleaning beam, each of which can use either ion source.

Ions from two emitters (A and C) can reach either of two positions: 'Analyze' or 'Clean', depending of the Beam Switch (BS) in the center. The focusing elements are electrically shared, as only one beam can be active at any time. Chopper and Bunchers (CB) provide the pulsed beam for analysis, the deflection plates (PX,PY) are used for steering the beam spot on the target.

On the analyse channel, a first lens LA1 (or LC1 in the backup configuration) gives an image of the emitter in the inlet plane of the CHOPPER, then the buncher compresses the ion beam into the short pulses required on the target. A second lens LA2 builds the final image on the target sample.

The other ion beam used for cleaning has a first lens LC1 (or LA1 in the backup configuration), which gives an image used by LC2 to build the final image on the target in the clean position. The ion beam for cleaning is not pulsed.

### 2.2.5 Time-Of-Flight Spectrometer (TOF)

The Time Of Flight spectrometer consists of an ion extraction part, an ion reflectron and a detector. The ion extraction section is equipped with deflection plates (TX, TY) to control which ions can reach the detector. The reflectron removes some energy dispersion of incident ions and improves the mass resolution of the instrument. The detector is of micro sphere type.

### 2.2.6 TDC

The Time to Digital Converter is a digital counter measuring the time of flight for each individual ion. The device is controlled by the onboard computer. The accumulated measurement represents the time-of-flight spectrum of COSIMA.

## 2.3 Data Handling Process

All PDS data products will be prepared at the Finnish Meteorological Institute (see chapter 1.7 for contact information). All data processing levels mentioned in this document are PSA-compliant, as defined in RO-EST-PL-5011.

Level 1a COSIMA data will be fetched from the Rosetta Data Distribution System (DDS) by FMI, where it will be processed to Level 2 (REFDR), and further to Level 3 products.

COSIMA Level 2 (REFDR) products are:

- Time-of-flight spectra, with automatically calibrated mass scale and relevant housekeeping data. Spectra can be of either Positive or Negative ions.
- Onboard calculated peak list and relevant housekeeping data. The spectrum is given as counts per integer mass lines, separated to organic and inorganic massed.
- Scan over substrate position or some measurement control parameter and relevant housekeeping data. The data is total counts of the events from the time-of-flight spectra for three possible mass/time ranges. The time range of the scan can contain spectra or peak list data.
- Substrate heating information.
- Substrate cleaning with the ion beam and the related housekeeping data.
- Substrate images. The images can be illuminated with either plus (right) side or minus (left) side led.
- Substrate dust grain feature (position, size, brightness) lists and relevant housekeeping data.
- Substrate history (auxiliary data)

The mass scale is calibrated with only two lines:

- positive mode
  - H or  $^{12}\text{C}$  for low masses
  - $^{115}\text{In}$  or  $^{107}\text{Ag}$  or  $^{109}\text{Ag}$  for high masses
- negative mode
  - H or CH for low masses
  - Cl or Br for high masses

There is no dead time correction nor background removal. The user should always check the calibration for any scientific analysis.

For the peak lists, the separation between organic and inorganic peaks is done according to the following formula:

Starting from the integer mass (M), the mass intervals are calculated in the following way

- inorganic ions:  $M \cdot 1.0003 - \Delta m \dots M \cdot 1.0003$
- organic ions:  $M \cdot 1.0003 \dots M \cdot 1.0003 + \Delta m$

where  $\Delta m = 0.2$

From that, based on the established mass scale, the time bins corresponding to the mass ranges are summed up as organic and inorganic peak values. Of course the peak list is just for getting an overview of the spectra, not for real scientific analysis.

For the calculated mass scale, a confidence number is calculated. This number is the procentual amount of counts inside the mass windows compared to the total counts. The mass window is defined as

$$m^*f \pm m^*p^*q, \text{ where}$$

$$p = \log(0.3/0.05)/\log(300/12)$$

$$q = 0.05 / (12^p)$$

which gives mass  $12 \pm 0.05$  and mass  $300 \pm 0.3$ . If suitable peaks to establish the scale cannot be found, the confidence number is 0.0% and the mass scale is calculated from the default values.

In the products PDS header there is a label DATA\_QUALITY\_ID. This is “-1”, when the mass scale is calculated by the software. In the future, when real comet dust spectra will be analyzed, the flag may change to inform, that the mass scale is established either by human or more advanced analysis software. When that happens, the product label will contain the description of the new flag values.

The HK data for the spectra and images is given in already calibrated form, without raw values. They can be used to check, if there's some instrument setup reason, why the spectrum signal to noise ratio or peak shape is as it is. The HK values don't contribute anything numerical to the spectrum mass scaling and are for background information only. The same goes with the image data.

**It should be pointed out, that an established mass scale is already an interpretation of the data and regardless of the flag, each data user should check the scale. And the substrate coordinate system used for the TOF-SIMS has some extra offset due to mechanical and ion path reasons, and differs for the positive and negative data. This offset can only be solved by analysing the TOF-SIMS data.**

## 2.4 Overview of Data Products

### 2.4.1 General

COSIMA contains 24 target holders, each having three different substrates for dust collection. From data analysis point of view, each substrate has different history. Each substrate can be exposed to dust, heated, imaged with COSISCOPE, and measured and cleaned by ion beam.

The data user should start the data analysis from the substrate history file stored in the substrate subdirectory in the data directory. The history files contain time ordered information from actions taken with the substrate in question. For exposure and storage there is only the time period. For the following products the archive pointer is given:

- time of flight ion spectrum. The main product of COSIMA, taken from a small area from the substrate surface. The preliminary mass scale is automatically generated with the equivalent software as onboard COSIMA for the peak list generation.
- peak list. The peak list is generated onboard COSIMA for integer mass lines for organic and inorganic masses separately. It may be used for pre-analysis of the grains, when full spectra would be too large to send due to operational and telemetry quota constrains
- scan. The measurement position or some measurement parameter is varied. The product is the total counts from the three possible time/mass ranges. During the scan COSIMA can also generate spectrum or peak data for each scan step value.
- image. The image is a COSISCOPE compressed image take from the whole substrate. The transmitted image may also contain only a subset of the image. This is indicated with the mask either in the FITS file header or in the housekeeping data. There are also test images taken either by purpose or due to instrument communication error.
- grain list. The COSISCOPE can detect individual dust grains from the substrate surface and

provide them as a list with position, size and illumination characteristics. There are also test grain lists from the test images. Note that consecutive grain lists may vary due to mechanical positioning and illumination differences.

- heat. The substrate is heated and the heat curve is available as the product.
- clean: The substrate is cleaned by the ion beam.

The relevant calibrated housekeeping data is provided together the data products for background information. They don't contribute anything numerical to the data products calibration.

During the ground calibration phase only few substrates were actively used for instrument calibration. These operations must be anyway used for background information in interpreting data during the comet phase.

Before the comet phase no real science is expected to be available from data.

Geometry information for the COSIMA products is not available. As the substrate exposure will take at least hours, often days, there is no simple way to tell, where the dust particles originate from. The data user should pick the exposure/collect period(s) from the substrate history file and make his/her own judgment. The time the individual spectrum or peak list product is made, has no connection to the time the dust particle is collected.

## 2.4.2 Software

### 2.4.2.1 Data processing software

An automatic script will retrieve data from the DDS and store it in an internal database. The housekeeping data will be plotted internally to check the general status of the instrument.

For PSA-compliant level 2 products generation (REFDR), data is retrieved from the internal database. The housekeeping data is calibrated with calibration coefficients stored in the RSDB, resulting in physical units. PDS data products are formed from mass spectra time series, parameter scan, substrate heating, substrate cleaning, COSISCOPE grain lists, COSISCOPE images, and calibrated housekeeping data. Peaks, images, and grain lists will need no additional calibration. In addition, target substrate history will be assembled as ancillary data products.

This software producing level 2 data from level 1b data stored in the internal database will be used only by the data producers and will not be archived.

Transformation of TOF spectra into mass spectra is done automatically with the equivalent software onboard the COSIMA instrument. See chapter 2.3.

### 2.4.2.2 Scientific analysis software

N/A. Data product files will be either ASCII TABLEs or FITS IMAGEs. For the FITS standard based images the DS9 software is recommend.

## 2.4.3 Documentation

The COSIMA instrument is extensively described in a paper "COSIMA, a High Resolution Time of Flight Spectrometer for Secondary Ion Mass Spectroscopy of Cometary Dust Particles" by Kissel et.al. [RD-02]. That paper together with this EAICD can be found from the DOCUMENT directory.

## 2.4.4 Derived and other Data Products

N/A

## 2.4.5 Ancillary Data Usage

The COSIMA instrument measures "off-line" in the sense that target assemblies are exposed independently of any spacecraft or COSIMA activity. For each target substrate, a list containing substrate history, including exposure time period, heating in the chemistry station, cleaning, analyzing and imaging is provided. The list is formatted as a table and stored in the same directory with the science products

obtained from that substrate.

As stated in the 2.4.1, these history files are the starting point of the COSIMA data analysis.

### 3 Archive Format and Content

#### 3.1 Deliveries and Archive Volume Format

There will be only one dataset available at all times. For all the pre-comet phases, it will be named RO-CAL-COSIMA-3-Vx.y. For the comet phase, the dataset name will be changed to RO-C-COSIMA-3-Vx.y.

For each delivery, the new data is incremented to the old data and the major version number is incremented by one. This scheme is used to make sure, that the data user always have the full substrate history available. The history products are essential in the spectrum interpretation and are the recommended starting point for the data browsing. The following delivery schedule is expected:

dataset ID	coverage	date
RO-CAL-COSIMA-2-V1.0	Ground calibration, commissioning, first cruise phases. No mass scale available	2006
RO-CAL-COSIMA-3-V2.0	adds active checkout data up to PC8	2008
RO-CAL-COSIMA-3-V3.0	adds active checkout data up to hibernation	2010
RO-C-COSIMA-3-V1.0	adds comet prelanding data	end 2014
RO-C-COSIMA-3-V2.0	adds comet escort 1 data	mid 2015
RO-C-COSIMA-3-V3.0	adds comet escort 2 data	end 2015
RO-C-COSIMA-3-V4.0	adds comet escort 3 data	mid 2016
RO-C-COSIMA-3-V5.0	adds final data	end 2016

The passive checkouts do not contribute much to the dataset, only one target is taken from the target storage and deposited back. No measurements are made.

The dataset is organized according to tree structure in the illustration 3.1.

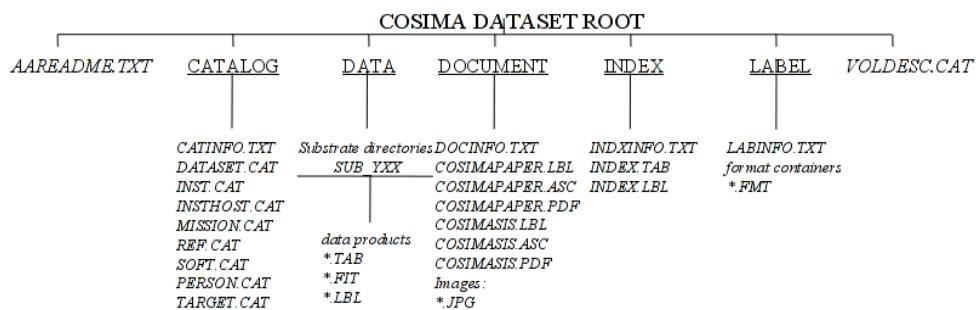

Illustration 1:

#### 3.2 Conventions

##### 3.2.1 Data Set ID Formation

Data set ID will be formed according to PDS standards and following the Rosetta Archive Plan (RO-EST-PL-5011). It will have the following components:

- Instrument host: RO
- Target: CAL for pre-flight data set, C for in-flight data set
- Instrument: COS

- Data processing level number, 3.
- Version number

The pre-comet dataset naming is thus starting from "RO-CAL-COSIMA-2-V1.0" and changed in the comet phase to names starting from "RO-C-COSIMA-3-V1.0"

### 3.2.2 Data Directory Naming Convention

/DATA directory be divided to subdirectories for each Cosima target substrate. The subdirectory names will be of format SUB\_YXX, where Y (1-3) is the substrate position in the target assembly, and XX is target assembly ID numbered from C1 to D8 hexadecimal. For example: SUB\_1C1, SUB\_2C1, etc. Substrate numbering is also explained in Chapter 4.1

### 3.2.3 Filenaming Convention COSIMA data products will be named as follows:

- Spectra: CS\_YXX\_YYYYMMDDThhmmss\_SP\_Z.TAB, where YXX is substrate code as defined above (chapter 3.2.2), and Z is either 'P' for positive or 'N' for negative ions.
- Peak lists: CS\_YXX\_YYYYMMDDThhmmss\_PK\_Z.TAB, where YXX and Z as above.
- Scan: CS\_YXX\_YYYYMMDDThhmmss\_SCAN.TAB, where YXX as above
- Heat: CS\_YXX\_YYYYMMDDThhmmss\_HEAT.TAB, where YXX as above
- Cleaning: CS\_YXX\_YYYYMMDDThhmmss\_CLEA.TAB, where YXX as above
- Cosiscope images of substrates: CS\_YXX\_YYYYMMDDThhmmss\_IM\_Z.FIT, where YXX as above, and Z is either 'P' for plus side led or 'M' for minus side led illumination.
- Grain lists: CS\_YXX\_YYYYMMDDThhmmss\_GR\_.TAB, where YXX as above.
- Housekeeping files: CS\_YXX\_YYYYMMDDThhmmss\_S\_HK.TAB (for spectra and peak lists), CS\_YXX\_YYYYMMDDThhmmss\_SCHK (for scan housekeeping), CS\_YXX\_YYYYMMDDThhmmss\_CLHK (for cleaning housekeeping) or CS\_YXX\_YYYYMMDDThhmmss\_G\_HK.TAB (for images and grain lists). YXX as above.
- Substrate history (ancillary data): CS\_YXX\_SUBSTRATE\_HIST.TAB

YYYYMMDDThhmmss is the date and time of operation start in UTC.

## 3.3 Standards Used in Data Product Generation

### 3.3.1 PDS Standards

PDS standard used is 3.6. All data processing levels mentioned in this document are PSA-compliant, as defined in RO-EST-PL-5011.

### 3.3.2 Time Standards

Time standard used is UTC. Time format is YYYY-MM-DDThh:mm:ss.

#### 3.3.2.1 Spacecraft Clock Count, OBT

The PDS keywords SPACECRAFT\_CLOCK\_START\_COUNT and SPACECRAFT\_CLOCK\_STOP\_COUNT refer to OBT as defined in [AD 04, Rosetta Time Handling, chapter 4.2]]

The header of the experiment telemetry source packets contains the data acquisition start time in OBT as 32 bit of unit seconds followed by 16 bit of fractional seconds (see section 2.3). OBT = 0 is at 2003-01-01-T00:00:00 UTC. The time resolution is 2-16 = 1.53×10-5 seconds.

The OBT is represented in the following format:

SPACECRAFT\_CLOCK\_START/STOP\_COUNT =

"<reset number>/<unit seconds>.<fractional seconds>"

The unit seconds and the fractional seconds are separated by the full stop character. Note that this is

not a decimal point. The fractional seconds are expressed as multiples of  $2^{-16} = 1.53 \times 10^{-5}$  seconds and count from 0 to  $2^{10}-1 = 65535$ . E.g. in SPACECRAFT\_CLOCK\_START\_COUNT = "1/21983325.392" the 392 fractional seconds correspond to  $392 \times 2^{-16} = 0.00598$  decimal seconds.

The spacecraft clock could be reset during the mission (although this is not planned). This would imply a change of the zero point. The zero point of the OBT will be indicated by pre-pending the reset number (integer starting at 1) and a slash to the unit seconds, i.e. "1/" means OBT = 0 at 2003-01-01T00:00:00 UTC.

Examples:

SPACECRAFT\_CLOCK\_START\_COUNT = "1/21983325.39258"

SPACECRAFT\_CLOCK\_START\_COUNT = "1/21983325.392"

SPACECRAFT\_CLOCK\_STOP\_COUNT = "1/21983342"

### 3.3.3 Reference Systems

N/A

### 3.3.4 Other Applicable Standards

A&A 524, A42 (2010) Definition of the Flexible Image Transport System (*FITS*),

version 3.0

## 3.4 Data Validation

Formats will be checked with PSA Validation and Verification Tool.

The instrument data is validated according to the outline of the COSIMA proposal and the COSIMA instrument paper (Kissel et al, to be published in 2006 within the frame of the ROSETTA instrument papers). COSIMA consists of groups in France, Finland and Germany and Cols ins the US, Austria and The Netherlands. The COSIMA laboratory reference model is located at the Max-Planck-Institut for Solar System Research in Katlenburg-Lindau, Germany. The COSIMA instrument is operated by FMI in Helsinki, Finland and MPS in Lindau, Germany. The reference model is used for calibration and cross-reference measurements of the COSIMA flight model. The flight data will be analysed in a near time frame. Since COSIMA stores the original cometary samples, with this approach interesting samples can be screened again, e.g. with an improved count statistics. The science goals are achieved in the pre-comet rendevous phase preparation with the reference model laboratory measurements and with the operational scenario of COSIMA in the comet orbiting phase of ROSETTA.

## 3.5 Content

### 3.5.1 Volume Set

1 volume will contain 1 COSIMA data set. Data set structure is defined in Chapter 3.1.

### 3.5.2 Data Set

COSIMA data will form one data set. It will contain time-of-flight spectra, peaks lists, target substrate images, grain lists and target history (ancillary data) obtained after the flight targets were installed in the flying instrument (XM).

The data set will be named according to PDS standards and following the Rosetta Archive Plan (ROEST-PL-5011). Each component of the name will match the corresponding component of the data set ID.

Data set name components are:

- Instrument host: ROSETTA-ORBITER
- Target: CAL for pre-comet phase, 67P for comet phasedata sets
- Instrument name: COSIMA

- Data processing level, 3
- Version number

Example: "ROSETTA-ORBITER 67P COSIMA 3 V3.0"

### 3.5.3 Directories

#### 3.5.3.1 Root Directory

General archive description: AAREADME.TXT, VOLDESC.CAT

#### 3.5.3.2 Calibration Directory

N/A

#### 3.5.3.3 Catalog Directory

CATINFO.TXT

MISSION.CAT and INSTHOST.CAT from ESA – Mission and spacecraft descriptions.

INST.CAT – Instrument description

DATASET.CAT – Dataset description

REFERENCE.CAT - References

SOFTWARE.CAT - empty for COSIMA datasets.

PERSON.CAT – COSIMA contacts

TARGET.CAT – Target descriptions

#### 3.5.3.4 Index Directory

INDXINFO.TXT, INDEX.LBL and INDEX.TAB

#### 3.5.3.5 Browse Directory and Browse Files

N/A

#### 3.5.3.6 Geometry Directory

N/A

#### 3.5.3.7 Software Directory

N/A

#### 3.5.3.8 Gazetteer Directory

N/A

#### 3.5.3.9 Label Directory

LABINFO.TXT

Format containers (\*.FMT)

#### 3.5.3.10 Document Directory

COSIMASIS: This EAICD with detached labels and images in JPG format.

COSIMAPAPER: COSIMA instrument paper with detached labels and images in JPG format

#### 3.5.3.11 Extras Directory

N/A

### **3.5.3.12 Data Directory**

See chapter 3.2.2.

## 4 Detailed Interface Specifications

### 4.1 Structure and Organization Overview

/DATA directory will be divided to sub-directories for each COSIMA target substrate. Names of these sub-directories will follow the scheme defined in chapter 3.2.2.

The target substrate code in the directory name consists of 3 alphanumeric characters. The last two characters represent hexadecimal code of the target substrate. There are 24 target assemblies, numbered C1-D8 (hex). Each assembly holds 3 substrates, resulting in total of 72 substrates. The first character in the code is a number defining the substrate position in the assembly. Possible numbers are 1,2 and 3 for top, middle and low substrate, respectively. Thus directory name SUB\_1C1 identifies that the data inside contains measurements of top substrate of target assembly C1. Other directories containing measurements of target assembly C1 are SUB\_2C1 and SUB\_3C1.

Data products will be stored in sub-directories SUB\_XYY. File naming of the data files is described in chapter 3.2.3. Each sub-directory SUB\_XYY will also include the history of that substrate. The history contains information about substrate storage and expose periods, cleaning and heating actions, COSISCOPE camera images and grains lists and any spectra taken. The history product contains history from the moment substrates were installed in the COSIMA flight instrument.

### 4.2 Data Sets, Definition and Content

See chapter 3.5.2.

### 4.3 Data Product Design

#### 4.3.1 Time-of flight spectrum product

##### 4.3.1.1 General description

COSIMA time-of-flight spectrum product has the following elements:

- Time-of-flight spectrum: event count series in ascii format.
- Event count: number of events in a time bin.
- Mass: calibrated mass for the time bin.

##### 4.3.1.2 Label example

### 4.3.3 Time-of-flight spectrum housekeeping data product

#### 4.3.3.1 General description

With each measured time-of-flight spectrum or peak list, housekeeping data is associated. The housekeeping product has the following elements:

- Voltages, currents and temperatures of the instrument during spectrum measurement
- TDC unit timing parameters
- TDC unit calibration results

Detailed contents of the elements are described in the label example below.

#### 4.3.4 Scan data product

##### 4.3.4.1 General description

With each scan step, the following elements are given:

- total counts in the three time/mass ranges
- number of ion shots
- total counts
- substrate position
- time/mass range limits
- varied parameters, step values

Detailed contents of the elements are described in the label example below.

#### 4.3.4.2 Label example

#### 4.3.5 Scan housekeeping data product

##### 4.3.5.1 General description

With each scan step, housekeeping data is associated. The housekeeping product has the following elements:

- Voltages, currents and temperatures means of the instrument during spectrum measurement
- TDC unit timing parameters
- TDC unit calibration results

Detailed contents of the elements are described in the label example below.

### 4.3.9 COSISCOPE image product

#### 4.3.9.1 General description

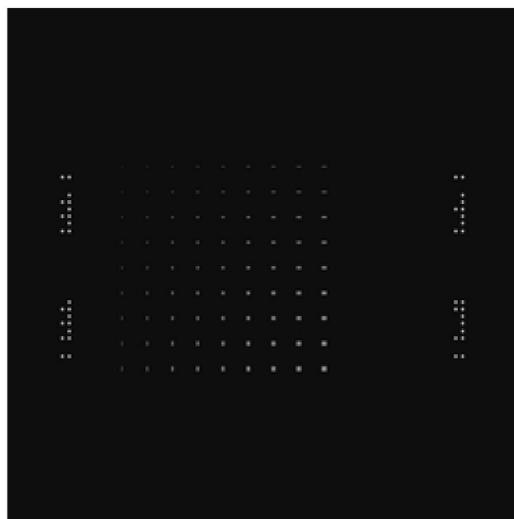

COSISCOPE image contains an image of target substrate in FITS format. P or M in the end of the product ID corresponds to the led illumination from Plus side (right) or Minus side (left).

The image can be only a subimage. The subimage mask is given either in the FITS header or in the housekeeping data. The subimage mask bits are numbered in the following way.

Bytes 8,7	Bytes 6,5	Bytes 4,3	Bytes 2,1
1	9	1	9
2	10	2	10
3	11	3	11
4	12	4	12
5	13	5	13
6	14	6	14
7	15	7	15
8	16	8	16

Given a 64bit mask in the hex form 0x0201 0804 2010 8040 would define a diagonal from top left to bottom right.

Some of the images are intentionally or due to instrument error test images, looking like the one below.

#### 4.3.10 COSISCOPE dust grain list product

##### 4.3.10.1 General description

COSISCOPE dust grain list can be associated with a Cosiscope image product, or it can be self-standing. Dust grain list product contains a list of dust grains (also called features) found on a target substrate.

Some of the grain lists are from the test images, taken intentionally or due to instrument error. Then the grain list nominally has 103 grains detected.

#### 4.3.11 COSISCOPE housekeeping product

##### 4.3.11.1 General information

With each Cosiscope grain list, housekeeping data is associated. If the grain list has a corresponding Cosiscope image, the housekeeping data applies also to that image. The Cosiscope housekeeping product has the following elements:

- Cosiscope temperatures
- Substrate positioning information
- Imaging information

Detailed description of the Cosiscope housekeeping product is given in the label example.

#### 4.3.12 Substrate history ancillary product

##### 4.3.12.1 General description

Substrate history product contains information about substrate storage and expose periods, cleaning and heating actions, COSISCOPE camera images and grains lists and any spectra taken. The history product contains history from the moment substrates were installed in the COSIMA flight instrument.

## 5 Appendix: Directory Listing of Data Set RO-CAL-COSIMA-3-V4.0

### TOP-LEVEL-DIRECTORY

- AAREADME.TXT	This file
- VOLDESC.CAT	Description of the data volume
- [CATALOG]	The directory containing information about COSIMA calibration data set
- CATINFO.TXT	Info about CATALOG directory contents
- MISSION.CAT	Rosetta mission description, provided by Rosetta project
- INSTHOST.CAT	Rosetta spacecraft description, provided by Rosetta project
- INST.CAT	COSIMA instrument description
- DATASET.CAT	Dataset description
- SOFT.CAT	Software description. Empty for COSIMA datasets
- PERSON.CAT	Dataset provider contact information
- REF.CAT	References
- TARGET.CAT	Target descriptions
- [DATA]	The directory for instrument data products
- [SUB_YXX]	Substrate YXX data products, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal
- CS_YXX_SUBSTRATE_HIST.TAB	Substrate history product, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal
- CS_YXX_YYYYMMDDTHHMMSS_SP_Z.TAB	Substrate spectrum, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done

- in hexadecimal. YYYYMMDDTHHMMSS is the date. Z is either P for positive or N for negative spectrum.
- CS\_YXX\_YYYYMMDDTHHMMSS\_PK\_Z.TAB  
Substrate peak list, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date. Z is either P for positive or N for negative peak list.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_S\_HK.TAB  
Substrate spectrum or peak list housekeeping data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_SCAN.TAB  
Substrate scan data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_SCHK.TAB  
Substrate scan housekeeping data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_HEAT.TAB  
Substrate heating data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_CLEA.TAB  
Substrate cleaning data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.

- CS\_YXX\_YYYYMMDDTHHMMSS\_CLHK.TAB  
Substrate cleaning housekeeping data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_GR\_\_.TAB  
Substrate grain list, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_IM\_Z.FIT  
Substrate FITS-format image, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date. ZZ is either P for right (plus) side led or M (minus) for left side led illumination.
  - CS\_YXX\_YYYYMMDDTHHMMSS\_G\_HK.TAB  
Substrate grain list or image housekeeping data, where Y is substrate target holder position 1=top, 2=middle, 3=bottom. XX is target holder ID number, range from C1 to D8, where counting is done in hexadecimal. YYYYMMDDTHHMMSS is the date.

- [DOCUMENT]

  - DOCINFO.TXT  
The directory for documentation
  - COSIMASIS.ASC  
Info about DOCUMENT directory contents
  - COSIMASIS.PDF  
COSIMA PDS interface description in ASCII format
  - COSIMASISXXX.JPG  
COSIMA PDS interface description figures for ASCII version, XXX is gives the figure number in the form 001, 002
  - COSIMAPAPER.ASC  
COSIMA instrument paper in ASCII format

- COSIMAPAPER.PDF	COSIMA instrument paper in PDF format
- COSIMAPAPERXXX.JPG	COSIMA instrument paper images in JPG format.
