

Enable/Disable CCU meas. debug mode
File: H_CRP_CCU_DEBU.xls
Author: E. Picallo

Procedure Summary

Objectives

This procedure describes the steps needed to enable or disable the CCU meas. Debug mode.

The sensor measurements are provided with internal offset cancellation. Enabling debugging mode will cause the offset itself being provided for sensors in monitoring.

Summary of Constraints

Debugging is contingency operation of CCU and is disabled by default.

Enabling of the debug mode should only be performed if the Meas underflow error flag (KM045300/KM45301) was observed to be set (i.e. toggling).

The debug mode should be disabled (and return to nominal monitoring) after the investigation.

To command the Arm Config, the DLCM function and CCU valves shall not be armed nor activated.

The decontamination Heating Function shall be stopped.

The telecommand Config Arm, enables configuration loading for the next frame only. Therefore 1 sec after (next frame) the Config Arm is executed, the telecommand to Configure FPGA to enable Meas. Debug shall be executed.

To ensure those timing constrains, the telecommands are time-tag. Thus the MTL function shall be running.

Spacecraft Configuration

Start of Procedure

CCU A/B switch ON and declared ON and valid on S/C Bus and configured ON in the UIU table,
CCU A/B meas. Debug mode Enable or Disable,
CCU A/B in monitoring mode

End of Procedure

CCU A/B switch ON and declared ON and valid on S/C Bus and configured ON in the UIU table,
CCU A/B meas. Debug mode Enable or Disable,
CCU A/B in monitoring mode

| 1 | | Warning | | Next Step: 2 |
| | | Debugging is contingency operation of CCU and should be disabled by default. | | |
| | | In case Underflow error during measurement is detected (AD-conversion saturated at low end) which is an indication of malfunction because sufficient offset is inherently added in signal path, the meas. debug feature can be used to search the cause of malfunction. | | |
| | | The sensor measurements are provided with internal offset cancellation. Enabling debugging mode will cause the offset itself being provided for sensors in monitoring. | | |
| | | Offset cancellation is done by measuring the signal with current injected to sensor and the offset similarly but without current injection, and subtracting these. Meas. Debugging feature can be used if data or status show anomalies, or there is otherwise reason to believe error in signal or offset measurement. | | |
| 2 | | <i>Is CCU A/B in monitoring mode for Decontamination (period 8 sec)?</i> | | Next Step: no 3 yes 4 |
| 3 | | <i>TM acquisition period change (CCU A and B)</i> | | Next Step: 4 |
