

Switch ON Tx and TWTA in use contingency
File: H_CRP_TTC_TU01.xls
Author: E. Picallo

Procedure Summary

Objectives

This procedure describes the steps needed to switch ON the transmitter and the travelling wave tube assembly in use in a contingency case. Therefore both TTC chains (nominal and redundant chain) are switched OFF before switching the TTC chain in use back ON.

This procedure does use the logical addressing.

Summary of Constraints

TWTAl&2 are switched OFF a through ASW TCs(8,4,115,1). TXs are switched OFF by dedicated commands to switch OFF the TX RF relay and set the relevant RT OFF and Invalid on the Bus. This is a temporary implementation to cope with the current CDMS ASW version with respect to the actual new TTC configuration where both TXs LCLs are always kept ON.

TX and TWTA in use are switched ON a through ASW TCs(8,4,115,2); moreover the XPND1 and the TM encoder are configured using TC(8,4,115,9), TC(8,4,115,17/18) and TC(8,4,115,20), thus the status of the ASW function "TTC Management" has to be "running".

This procedure to Switch TX and TWTA in use ON does not include a re-configuration of the RFDN switches.

Note that:

- the value of the TM modulation index is always 1.2;
- the Coherent mode and Ranging modulator are set OFF because these parameters have to be commanded ON after confirmation of on-board lock;
- the value of the Output power level is always - 4dBm;
- the External reference and Internal bit pattern generator

Spacecraft Configuration

Start of Procedure

CDMU in default configuration;

End of Procedure

CDMU in default configuration;
Downlink enabled via TX and TWTA in use.
