Procedure Summary

Objectives

The objective of this Herschel ACMS procedure is for the routine execution of single target pointings in SCM.

The procedure involves the following activities:

- check ACMS configuration
- select & uplink the Fine Pointing command
- verify slew start
- verify pointing an interlacing, if necessary

It is used when SCM fine pointing is needed during routine science operations, so specifies as a constraint that ACMS must already be in SCM pointing (N.B. this is the final ACMS state after any pointing command, including rasters and scans). It is a basic tool used in many high level calibration procedure (e.g. calibration of STR LOS against the payload, determination of GYR scale factor, alignment and bias, determination of wheel friction and disturbance torques).

NOTE: Procedures for first entry into SCM and return to SCM after an orbit correction manoeuvre are specified separately and do not rely on this procedure to execute the necessary command.

Summary of Constraints

Prior to execution in routine operations, the ACMS must be in conditions which will prevent the triggering of TC execution checks.

All necessary conditions are verified by calling procedure Verify SCM Configuration, which carries out the following checks:

1. ACMS in SCM and pointing.
2. ACMS configuration allows execution of SCM pointing commands; i.e., the following conditions must be satisfied:
 - 2.1. No SIR
 - 2.2. No CIR
 - 2.3. No critical TC flag raised.
3. Unit configuration is sufficient to carry out an SCM pointing. The procedure accepts any valid unit configuration for SCM and is not limited to the defaults (RWL 1-2-3-4, GYR 1-2-3, STR1),
 - 3.1 One STR in active configuration, powered and healthy. STR mode = AAD, STR submode = ATFAD.
 - 3.2 At least three wheels in active configuration, powered and healthy
 - 3.3 One GYRE selected, powered and healthy.
 - 3.4 Three GYR sensors in active configuration are healthy

[N.B. Flight Dynamics ensure no wheel unloading when defining their TC inputs]

Beginning of Procedure				
<p>TC Seq. Name :PROC (Procedure Properties)</p> <p>TimeTag Type: Sub Schedule ID:</p> <p style="text-align: center;">□</p>				
1		Verify ACMS configuration		Next Step: 2
		Check suitable configuration for SCM pointing by calling procedure Verify SCM Configuration		
		Execute Procedure: H_FCP_AOC_3001 Verify SCM Configuration		
2		Select TPF for Science Mode Fine Pointing		Next Step: 3
		Check with Flight Dynamics the exact name of the TPF instance to be uplinked		
		<p>NOTE: The decision whether or not interlacing is to be used is taken off-line and is defined within the TPF instance delivered by Flight Dynamics.</p> <p>The selection defined within the TPF determines the execution of some verification steps.</p>		
		<p>NOTE: Flight Dynamics check that RWL profiles will not exceed any constraints during the manoeuvre (i.e. the wheel momenta should be sufficient to stay within allowed boundaries during the entire operation) when generating this TPF.</p> <p>If there is a likelihood of this happening, they will also provide an associated wheel bias TPF (RWB), to be applied beforehand (i.e. via H_SVT_AOC_4R20)</p>		
<p>TC Seq. 4		Verify start of slew		Next Step: 5
		Verify Packet Reception AccAsw TM_5_1_16427 - New mode_state Packet Details: APID: 512 Type: 5 Subtype: 1 PI1: 16427 PI2: 0	A51CSTATE109	
		Verify Packet Telemetry (Pkt = A51CSTATE109) Substate Event AE5ST109 = SCM Tracking		AND=ZAALH999
		The event packet indicates the start of slew as a change of substate. The change of substate occurs as soon as the slew path has been calculated by the path planner. The verification of the reception of the event packet may therefore be omitted and verification steps below can be executed as soon as the TC is acknowledged through TM(1,1).		
5		Verify pointing		Next Step: 6
		Verify Telemetry AcmsSubstate AESMF002 = SCM Pointing		AND=ZAA50999

		Verify Telemetry OnTargetFlag AESM0002	= HIGH	AND=ZAA50999
		Verify Telemetry ACMS Main AID AE5A0001	= SCM Point Fine	(None)
		The checks above are specified assuming that the commanded slew time was sufficient to cover the duration of both the rotation determined by the ASW path planner and the settling of the controller. If mission planners specify pointings with shorter slew times <u>only the check on AcmsSubstate should be executed</u> and all other checks should be omitted (AcmsSubstate is switched at the end of the path planner-controlled phase of the slew and all other status indicators change value only after settling).
