

MTL Uplink
 File: H_FCP_DHS_1011.xls
 Author: S. Manganelli

Procedure Summary

Objectives

To prepare and execute DTCP uplink to MTL

Summary of Constraints

At least one SSMM bank 0 ON, MTL buffer existing, Scheduling task started

Spacecraft Configuration

Start of Procedure

Any with MTL running

End of Procedure

Unchanged

Reference File(s)

Input Command Sequences

Output Command Sequences

HFD1011A
 HFD1011B

Procedure Flowchart Overview

MTL Uplink File: H_FCP_DHS_1011.xls Author: S. Manganelli	
---	--

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch	AIT Comment
Beginning of Procedure					
TC Seq. Name :HFD1011A (MTL Uplink (1)) TimeTag Type: N Sub Schedule ID: <input type="checkbox"/>					
1		Verify TC Counters and on board configuration		Next Step: 2	
		The MTL (Scheduling) task must be running. Note which SSMM buffer is "in use".			
		Verify Telemetry Mt1Sts DEH26170	= Running	AND=ZAZ7A999	
		Verify Telemetry Mt11LogSts DEH90170	Nom or Red	AND=ZAZ35999	
		Verify Telemetry Mt11Use DEH91170	In Use or not	AND=ZAZ35999	
		Verify Telemetry Mt11FailSts DEH88170	Failed or not	AND=ZAZ35999	
		Verify Telemetry Mt12LogSts DEH94170	Nom or Red	AND=ZAZ35999	
		Verify Telemetry Mt12Use DEH95170	In use or not	AND=ZAZ35999	
		Verify Telemetry Mt12FailSts DEH92170	Failed or not	AND=ZAZ35999	
2		Verify that no critical commanding activity must take place during the uplink		Next Step: 3	
		If yes, verify with SOE and SOM if MTL uplink is allowed during this period or if it should be suspended. Note anyway that no service 1,1 / 1,3 / 1,7 TM is generated by MTL uplink.			
3		Verify MCS configuration		Next Step: 4	
		1) For DTCP daily MTL unit uplinks, AD mode must be selected and initialized. This ensures the controlled stop of uplink in case of problems. In case only a few TCs have to be uplinked to the MTL this is not a constraint.			
		2) Some TCs may be defined in the DB with an interlock, that has a purpose only for real time commanding. To avoid this from stopping the uplink, the INTERLOCK function must be disabled from the MSTACK.			
		3) OBQD task must be running			

MTL Uplink
 File: H_FCP_DHS_1011.xls
 Author: S. Manganelli

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch	AIT Comment
		Ensure OBQD is synchronized with on board situation by commanding two service ll reports.			
		Execute Telecommand RetStatusOfCmdSchedule <i>TC Control Flags :</i> GBM IL DSE --Y -- --- <i>Subsch. ID : 10</i> Det. descr. : TEMPLATE ReportStatusOfCmdSchedule, TC(11,18), no appl. data	DCT25170	TC	
		Execute Telecommand ReportWholeTcSchedule <i>Command Parameter(s) :</i> N_Repetition DH041170 0 <dec> <i>TC Control Flags :</i> GBM IL DSE --Y -- --- <i>Subsch. ID : 10</i> Det. descr. : ReportWholeTcSchedule, TC(11,9)	DC83F170	TC	
		Select the OBQD "Dump Display" and perform first a "Retrieve" and then a "Refresh". All TCs should be green and marked MATCH.			
		Known OROD issues to be fixed in a future release : [current implementation marks UNEXPECTED the TCs that execute after the last summary dump] [Row count and direct Count of <non-MATCH> TCs will be displayed, filtering improved] [ENTRIES LEFT counter will display 50000 for empty MTL, not 35000] [Refresh of OBQD during uplink and simultaneous TC execution shall be improved]			
4		Check Time Correlation		Next Step: 5	
		TCO tab in TMSPACON. The TCO must be VALID and ACCURATE. If not, command 4 short memory dumps using the following TC (not inserted in TC sequence)until TCO achieves VALID and ACCURATE status. The TC just speeds up VC0 TM rate in order to receive more time couples in a short time.			
		Execute Telecommand DumpMem_AbsAddr <i>Command Parameter(s) :</i> Memory_ID DH003180 80 <hex> Start_Address DH004180 0 <hex> N DH105180 FFFF <hex> <i>TC Control Flags :</i> GBM IL DSE --Y -- --- <i>Subsch. ID : 10</i> Det. descr. : Dump Memory Using Absolute Addresses This Telecommand will not be included in the export	DC602180	TC	
5		Load the stack.		Next Step: 6	

MTL Uplink File: H_FCP_DHS_1011.xls Author: S. Manganelli	
---	--

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch	AIT Comment
		Note the total number of TCs to be uplinked			
6		Verify that there is enough space in the MTL to complete the uplink		Next Step: 7	
		TC slots already taken MtlTcCnt DE82F170		AND=ZAZ8T999	
		TC slots available for uplink MtlBufFree DEA74170		AND=ZAZ8T999	
		Nr of TC to be uplinked shall normally be less or equal to the value of DEA74170 MtlBufFree, so full the MTL can be uplinked without further problems. Should Nr of TC to be uplinked be larger than DEA74170 MtlBufFree : a) uplink can be started (at later step) only for line 1 to line [value of DEA74170 MtlBufFree] b) request opinion of on-call SOE. In principle : - determine by inspection of OBQD the value X = number of TCs that will be executed from now until LOS-30 min. - at LOS-30 min uplink of further X TCs can be started. Extra station support may have to be requested to complete uplink.			
7		Note current value of on-board counters		Next Step: 8	
		There are 4 on-board counters that will be updated by BSW and ASW when each TC(11,4) is uplinked to the MTL buffer. Mark the current value of these counters.			
		DID_BSW_TC_FV_GNDLO_PASS - Number of TCs with Source 4 passing format verification. BSWTCFvGndLPass DELN0160		AND=ZAZ8T999	
		DID_BSW_TC_TO_ASW - Number of TCs routed to ASW. BSW_TC_TO_BSW DELVF160		AND=ZAZ8T999	
		DID_ASW_ACCEPT_TC_CNT Accepted TC counter by ASW AcceptTcCnt DE85A170		AND=ZAZ8T999	
		DID_ASW_EXECUTED_TC_CNT Successfully executed TC counter by ASW ExecutedTcCnt DE863170		AND=ZAZ8T999	
8		Start Uplink		Next Step: 9	
9		Monitor uplink		Next Step: 10	
		Verify (increase due to MTL uplink from this and other stacks, decrease due to MTL TTAG TC execution) MtlTcCnt DE82F170		AND=ZAZ8T999	

MTL Uplink File: H_FCP_DHS_1011.xls Author: S. Manganelli	
---	--

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch	AIT Comment
		Verify (sum of this parameter and DE82F170 should be constant at 50000) <div style="text-align: center;"> MtlBufFree DEA74170 </div>		AND=ZAZ8T999	
		Filter TCHIST for TM(1,1) and TM(1,2) For service 1 TM : Uplink to MTL shall not generate success packets, however shall generate failure packets. The verifier shall now trap TC failures even if no ACK flags are set for TC(11,4).			
		In case of MTL TC failure in uplink: - stop uplink - analyze service 1 TM failure information on TMPH. Verify status of Time Correlator (should be VALID and ACCURATE) - consult on-call SOE. A decision may be taken to complete uplink but disable some APID and/or subschedule. - log problem in all cases			
End of Sequence					
TC Seq. Name : HFD1011B (MTL Uplink(2nd part)) HFD1011B TimeTag Type: N Sub Schedule ID: <input type="checkbox"/>					
10		At end of uplink, command a summary dump and cross-check completeness of MCS model		Next Step: 11	
		Execute Telecommand <div style="text-align: center;"> RetStatusOfCmdSchedule </div> TC Control Flags : <div style="text-align: center;"> GBM IL DSE --Y -- --- </div> Subsch. ID : 10 Det. descr. : TEMPLATE ReportStatusOfCmdSchedule, TC(11,18), no appl. data	DCT25170	TC	
		Execute Telecommand <div style="text-align: center;"> ReportWholeTcSchedule </div> Command Parameter(s) : <div style="text-align: center;"> N_Repetition DH041170 </div> TC Control Flags : <div style="text-align: center;"> GBM IL DSE --Y -- --- </div> Subsch. ID : 10 Det. descr. : ReportWholeTcSchedule, TC(11,9)	DC83F170	TC	
		Select the OBQD "Dump Display" and perform first a "Retrieve" and then a "Refresh". All TCs should be green and marked MATCH.			
11		Note current value of on-board counters		Next Step: END	
		There are 4 on-board counters that will be updated by BSW and ASW when each TC(11,4) is uplinked to the MTL buffer. Mark the current value of these counters.
