

Verify configuration matrices for FDIR
File: H_FCP_DHS_3060.xls
Author: cmevi-hp

Procedure Summary

Objectives

This procedure describes the steps needed to acquire the status of the following sets of flags (controlling the activity on the 1553 S/C bus):

- Remote Terminal Address, RTA, configuration matrix: settings specific for each terminal (nominal and redundant separately);
- Remote Terminal, RT, configuration matrix: settings specific for each logical unit (nominal and redundant together);
- Bus configuration matrix: settings for the entire bus protocol handling.

Summary of Constraints

n/a

Spacecraft Configuration

Start of Procedure

- CDMU in default configuration, that is:
- PM A or B ON (nominally A)
 - TM Encoder/OBT A or B active (nominally A)
 - RM A and B enabled
 - MM A and B ON

End of Procedure

- CDMU in default configuration, that is:
- PM A or B ON (nominally A)
 - TM Encoder/OBT A or B active (nominally A)
 - RM A and B enabled
 - MM A and B ON

1		Choose the bus or a remote terminal		Next Step: 2
2		SWITCH		Next Step: BUS 3 ACC_A 4 ACC_B 5 HIFI_A 6 HIFI_B 7 SPIRE_A 8 SPIRE_B 9 PACS_A 10 PACS_B 11 PCDU_A 12 PCDU_B 13 CCU_A 14 CCU_B 15 XPND1 16
				XPND2 17
<p><i>TC Seq. Name :HFD3060A (Acquire BUS matrix)</i></p> <p><i>TimeTag Type:</i> <i>Sub Schedule ID:</i></p> <p style="text-align: center;">□</p>				
3		Acquire matrix		Next Step: END
		Bus configuration matrix Nominal values are provided		
		The DLL FDIR can change the Active Bus flag in case of reconfiguration to the other Bus, provided the other Bus is flagged as Healthy.		
		Verify Telemetry Active_Bus_A_B DEFJ1160	= BUS_A	AND=ZAZAF999

Verify configuration matrices for FDIR
 File: H_FCP_DHS_3060.xls
 Author: cmevi-hp

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch
		<p>The Health flag of Bus A or B setting is taken into account after an on onboard detection of an error during communication with an RT. The BSW sets the flag of the Active Bus to 'Unhealthy' and the DLL FDIR sequence is triggered:</p> <ul style="list-style-type: none"> - In case the other Bus is also flagged as 'Unhealthy' a CDMU level 3 error is raised. - In case the other Bus is flagged as 'Healthy' provided the Data Wrap Around Tests for all RTs on both Bus returned no errors the Active Bus Health flag is reset to 'Healthy'. If the results of the Data Wrap Around Tests for all RTs on both Bus differ, other Bus is selected as Active. 		
		Verify Telemetry BusA_HealthySts DEFJ2160	= Healthy	AND=ZAZAF999
		Verify Telemetry BusB_HealthySts DEFJ3160	= Healthy	AND=ZAZAF999
		<p>The SDB FDIR flag enables/disables both the DLL and TFL FDIR. It is strongly recommended never to disable it, as no more onboard SDB error detection would occur.</p>		
		Verify Telemetry (only set by Ground) SDB_FDIR DEFJ4160	= ENABLED	AND=ZAZAF999
<p>TC Seq. Name :HFD3060B (Acquire ACC_A matrix)</p> <p>TimeTag Type: Sub Schedule ID: <input type="checkbox"/></p>				
4		Acquire matrices		Next Step: END
		<p>RTA configuration matrix Nominal values are provided</p>		
		<p>The TFL-TM FDIR flag enables to disable for a specific RT the TFL-TM FDIR. Note this flag is not linked to the SDB FDIR flag, i.e. it will not be modified when the global flag is set or reset. Therefore in case for a RT the TFL-TM FDIR was disabled, then the SDB global FDIR was disabled and subsequently enabled, the particular RT will still have its related TFL-TM FDIR disabled.</p>		
		Verify Telemetry ACCA_TFLTM DEF6L160	= ENABLED	AND=ZAZAF999

Verify configuration matrices for FDIR
 File: H_FCP_DHS_3060.xls
 Author: cmevi-hp

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch
		<p>The RTA On/Off status reflects the power status of the specified RT. Thus in case an RT is definitely failed, but cannot be turned OFF (eg. because a standard LCL has failed, or because the unit is powered via FCL) the status will still be ON.</p> <p>In that case the RTA Dead/Alive status allows to flag it as 'Dead' thus taking precedence over the erroneous On/Off status. This status can only be set by Ground.</p>		
		Verify Telemetry ACCA_On_Off DEF6G160	= ON	AND=ZAZAG999
		Verify Telemetry ACCA_Dead_Alive DEF6H160	= Alive	AND=ZAZAG999
		<p>The RTA Well TC/Sick TC reflects if the last TC packet transfer was successful or not. It is set the first time an error is detected. The same TC is then re-sent. If after the 2nd attempt the transfer has again failed and the RT is non Vital, the relevant RT FDIR will be triggered. In case of a Vital RT or if several non Vital RTs are set to 'Sick TC' a CDMU level 3 error is raised.</p> <p>Resetting the status to 'Well TC' can only be achieved by TC.</p>		
		Verify Telemetry ACCAWell_SickTC DEF6Z160	= Well	AND=ZAZAG999
		<p>The RTA Well TM/Sick TM reflects if more than the expected minimum number of TM packets for that RT have been received over a certain period of time specific to that RT. Both the minimum number and the period are part of the on board DB.</p> <p>It is set the first time an error is detected, to reset the status to 'Well TM' can only be achieved by TC.</p>		
		Verify Telemetry ACCAWell_SickTM DEF6J160	= Well	AND=ZAZAG999
		<p>The RTA Valid/Invalid status describes the RT availability. A RT will typically be labelled invalid when it is recognised to be reconfiguring.</p> <p>The RT <i>Invalid</i> to RT <i>Valid</i> transition is only performed upon dedicated TC.</p> <p>The only exception is : a Vital Active RT is declared temporarily <i>Invalid</i> during Vital RT FDIR sequence.</p>		
		Verify Telemetry ACCAValid_Inval DEF6K160	= Valid	AND=ZAZAG999
		<p>The RTA On/Off, Dead/Alive and Valid/Invalid statuses are used by the TFL FDIR. Only the RTs which are On, Alive and Valid will be submitted to the TFL TC FDIR. For the TFL TM FDIR in addition the RTA Well TM/Sick TM needs to be set at 'Well TM' for the FDIR to take place.</p>		
		RT configuration matrix Nominal values are provided

Step No.	Time	Activity/Remarks	TC/TLM	Display/ Branch
		To declare a logical unit (thus both nominal and redundant RTA) as <u>Vital</u> results in specific recovery actions. Currently, only the ACC is identified as a Vital RT; confirmed communication failure with a Vital RT (on both A & B 1553 Buses) leads to a CDMU level 3 reconfiguration. Vital/Non Vital status is maintained by the Ground.		
		Verify Telemetry ACC_Vit_NoVit DEFDFG160	= Vital	AND=ZAZAG999
		A part of the DLL FDIR, in case the failed RT is a Vital one, the first time round the RT is declared 'Invalid' for N seconds and the <u>Vital Loop counter</u> is incremented by one, ie set to 2. If after these N seconds the Bus anomaly is still present the vital RT is declared Invalid, the Redundant vital RT is now to be used and the Vital Loop counter is incremented by one, ie set to 3. If the Bus anomaly is still present with the redundant vital RT, the DLL FDIR will raise a CDMU level 3 error. This is only relevant for Vital RTs, thus at the moment only ACCs.		
		Verify Telemetry ACC_VitRT_Cnt DEFDFJ160	= 1 <dec>	AND=ZAZAG999
		The <u>RT Nominal/Redundant flag</u> reflects which RT is active. It can be set both by TC and FDIR.		
		Verify Telemetry ACC_No_Re_RTA DEFDFH160	= NOMINAL	AND=ZAZAG999
		Unlike the TC retry, which is always performed, the TM retry attempt can be enabled or disabled by the Ground. This is only relevant for intelligent RTs, thus not for PCDU, XPNDs and CCUs.		
		Verify Telemetry ACC_TMRetryOnOf DEFDFZ160	= ON	AND=ZAZAG999
<p>TC Seq. Name :HFD3060C (Acquire ACC_B matrix)</p> <p>TimeTag Type: Sub Schedule ID: <input type="checkbox"/></p>
